| 13.10 | Summary                | 82 |
| 13.11 | References             | 90 |

### Chapter 13 Commercial Fisheries figures are presented in Volume 2 and listed in the table below.

| Figure number | Title  |
|---------------|--|
| 13.1          | Study area   |
| 13.2          | Surveillance Sightings by Nationality (2011-2015) (MMO, 2018)                      |
| 13.3          | Surveillance Sightings by Method (2011-2015) (MMO, 2018)                           |
| 13.4          | Historic fishing rights between the UK's 6 and 12nm limit (UKHO, 2011)             |
| 13.5          | Average Dutch landings values (2012 to 2016) by method (IMARES, 2017)              |
| 13.6          | Average Dutch landings values (2012 to 2016) by species (IMARES, 2017)             |
| 13.7          | Average Dutch VMS values (2012 to 2016) by beam trawls (IMARES, 2017)              |
| 13.8          | Average Dutch VMS effort (2012 to 2016) by beam trawls (IMARES, 2017)              |
| 13.9          | Voluntary no pulse trawling zones (NFFO, 2018)                                     |
| 13.10         | Average Dutch VMS values (2012 to 2016) by seine netters (IMARES, 2017)            |
| 13.11         | Average Dutch VMS effort (2012 to 2016) by seine net (IMARES, 2017)                |
| 13.12         | Average Dutch VMS values (2012 to 2016) by pelagic (midwater) trawl (IMARES, 2017) |
| 13.13         | Average Dutch VMS effort (2012 to 2016) by pelagic (midwater) trawl (IMARES, 2017) |
| 13.14         | Average Dutch VMS value (2012 to 2016) by demersal otter trawl (IMARES, 2017)      |
| 13.15         | Average Dutch VMS effort (2012 to 2016) by demersal otter trawl (IMARES, 2017)     |
| 13.16         | Average Dutch VMS value (2012 to 2016) for purse seine and nets (IMARES, 2017)     |
| 13.17         | Average Dutch VMS effort (2012 to 2016) for purse seine and nets (IMARES, 2017)    |
| 13.18         | Average Dutch VMS values (2012 to 2016) for traps and dredges (IMARES, 2017)       |
| 13.19         | Average Dutch VMS effort (2012 to 2016) for traps and dredges (IMARES, 2017)       |
| 13.20         | Average Belgian landings values (2010 to 2014) by method (ILVO, 2016)              |
| 13.21         | Average Belgian landings values (2010 to 2014) by species (ILVO, 2016)             |
| 13.22         | Average Belgian VMS value (2010 to 2014) by beam trawls (ILVO, 2016)               |
| 13.23         | Average Belgian VMS effort (2010 to 2014) by beam trawls (ILVO, 2016               |
| 13.24         | Average Belgian VMS value (2010 to 2014) for demersal trawls (ILVO, 2016           |

| Figure number | Title  |
|---------------|--|
| 13.25         | Average Belgian VMS effort (2010 to 2014) for demersal trawls (ILVO, 2016)   |
| 13.26         | Average UK landings values (2012 to 2016) by method (MMO, 2018)  |
| 13.27         | Average UK landings values (2012 to 2016) by species (MMO, 2018)   |
| 13.28         | Potting grounds of UK fishermen identified through consultation (2014 to 2018)   |
| 13.29         | Trawling grounds of UK fishermen identified through consultation (2014 to 2018)  |
| 13.30         | Longlining grounds of UK fishermen identified through consultation (2014 to 2018)  |
| 13.31         | Netting grounds of UK fishermen identified through consultation (2014 to 2018)   |
| 13.32         | Average UK VMS values (2012 to 2016) for beam trawls (MMO, 2018)   |
| 13.33         | Average UK VMS effort (2012 to 2016) for beam trawls (MMO, 2018)   |
| 13.34         | Fishing effort in 2008 by French demersal trawlers and pelagic trawlers (CNPMEM, 2009)                                       |
| 13.35         | Fishing effort in 2008 by French demersal otter trawlers (CNPMEM, 2009)  |
| 13.36         | French fishing effort in 2014 by French demersal otter trawlers (IFREMER, 2015)  |
| 13.37         | French fishing effort in 2014 by French pelagic trawlers (IFREMER, 2015)   |
| 13.38         | Average Danish VMS effort (2011 to 2015) for sandeel trawl (Ministeriet for Fødevarer, Landbrug og Fiskeri, 2017)            |
| 13.39         | Average Danish VMS effort (2011 to 2015) for pelagic (midwater) trawl (Ministeriet for Fødevarer, Landbrug og Fiskeri, 2017) |
| 13.40         | Average German VMS vessel density (2007 to 2012) (German Federal Office for Agriculture & Food, 2013)                        |
| 13.41         | Location of other projects/ activities included in the cumulative assessment   |
| 13.42         | Location of other projects/activities in the proximity of the proposed East Anglia ONE North project                         |

### **Chapter 13 Commercial Fisheries** appendices are presented in **Volume 3** and listed in the table below.

### Glossary of Terminology

| Applicant                       | East Anglia ONE North Limited.  |
|---------------------------------|---|
| Applicant Beam Trawl            |   |
|                                 | A trawl net whose lateral spread is maintained by a beam across its mouth   |
| Beam trawl -Pulse Wing Trawling | Advanced adaptation of conventional beam trawling where the tickler chains and chain mat of the beam trawl are removed and replaced with trailing |
| wing framing                    | electrodes.   |
| Construction, operation         | A fixed structure required for construction, operation and maintenance  |
| and maintenance                 | personnel and activities.   |
| platform                        | personner and activities.   |
| Demersal fish                   | Fish living on or near the sea bed.   |
| East Anglia ONE North           | The proposed project consisting of up to 67 wind turbines, up to four offshore  |
| project                         | electrical platforms, up to one construction operation, and maintenance   |
| p. 0,000                        | platform, inter-array cables, platform link cables, up to one operational   |
|                                 | meteorological mast, up to two offshore export cables, fibre optic cables,  |
|                                 | landfall infrastructure, onshore cables and ducts, onshore substation, and  |
|                                 | National Grid infrastructure.   |
| East Anglia ONE North           | The offshore area within which wind turbines and offshore platforms will be   |
| windfarm site                   | located.  |
| Flatfish                        | Fish of the order Heterosomata of marine typically bottom-dwelling bony   |
|                                 | fishes such as soles, place and turbots, that as adults swim on one side of   |
|                                 | the laterally compressed body and have both eyes on the upper side.   |
| ICES rectangle                  | Spatial unit used for the collection of fisheries statistics which covers an area   |
|                                 | of approximately 900nm <sup>2</sup> , aligned to 30' latitude by 1° longitude.  |
| Inter-array cables              | Offshore cables which link the wind turbines to each other and the offshore   |
|                                 | electrical platforms, these cables will include fibre optic cables.   |
| Landfall                        | The area (from Mean Low Water Springs) where the offshore export cables   |
| 1 1 1                           | would make contact with land, and connect to the onshore cables.  |
| Longlining                      | Fishing method that involves setting out short lines carrying hooks, which are  |
|                                 | attached to a longer main line at regular intervals. The short lines are suspended horizontally at a predetermined depth with the help of surface |
|                                 | floats.   |
| Monitoring buoys                | Buoys to monitor <i>in situ</i> condition within the windfarm, for example wave and   |
| Wormoning budys                 | metocean conditions.  |
| Offshore cable corridor         | This is the area which will contain the offshore export cable between offshore  |
|                                 | electrical platforms and landfall jointing bay, these cables will include fibre   |
|                                 | optic cables.   |
| offshore development            | The East Anglia ONE North windfarm site and offshore cable corridor (up to  |
| area                            | Mean High Water Springs).   |
| Offshore electrical             | The transmission assets required to export generated electricity to shore.  |
| infrastructure                  | This includes inter-array cables from the wind turbines to the offshore   |
|                                 | electrical platforms, offshore electrical platforms, platform link cables and   |
|                                 | export cables from the offshore electrical platforms to the landfall.   |
| Offshore electrical             | A fixed structure located within the windfarm area, containing electrical   |
| platform                        | equipment to aggregate the power from the wind turbines and convert it into a   |
| Office and according to         | more suitable form for export to shore.   |
| Offshore export cable           | The cables which would bring electricity from the offshore electrical platforms   |
| Offichara infractoriations      | to the landfall, these cables will include fibre optic cables.  |
| Offshore infrastructure         | All of the offshore infrastructure including wind turbines, platforms, and  |
| Offshore platform               | A collective term for the offshore construction, operation and maintenance  |
| Onstiole platform               | platform and the offshore electrical platforms.   |
| Otter trawl                     | Nets which have otter boards fastened to the sides. When in motion under  |
| Ouel lawi                       | Trots which have often boards rastened to the sides. Which in motion under  |

|                     | water, the boards pull away from each other resulting in the net opening up in a horizontal direction. Demersal fisheries as well as pelagic fisheries can apply this technique.   |
|---------------------|--|
| Pelagic fish        | The term pelagic fish covers species found mainly in shoals in midwater or near the surface of the sea.  |
| Platform link cable | An electrical cable which links one or more offshore platforms, these cables will include fibre optic cables.  |
| Potting             | Fishing method which uses baited traps (posts) to target shellfish species, most commonly lobsters and crabs. Pots have a tapered entrance that makes it easy for shellfish to enter, but very difficult for them to find the way out. |
| Safety Zones        | A marine area declared for the purposes of safety around a renewable energy installation or works / construction area under the Energy Act 2004.   |
| Seine netting       | A method of fishing that employs a Seine or dragnet. The net hangs vertically in the water with the bottom edge held down by weights and the top edge buoyed by floats.  |

### 13 Commercial Fisheries

#### 13.1 Introduction

- This chapter of the Preliminary Environmental Information Report (PEIR) describes the current commercial fisheries baseline and provides an assessment of the potential impacts of the proposed East Anglia ONE North project on commercial fishing. The areas of the proposed East Anglia ONE North project that are of relevance to this assessment include the East Anglia ONE North windfarm site and the offshore cable corridor. Collectively these are referred to as the offshore development area.
- 2. For the purposes of this assessment commercial fishing is defined as fishing activity undertaken by licenced fishing vessels for the legitimate capture and sale of fish and shellfish. This chapter is focused on fishing fleets that are active in areas relevant to the offshore development area. These include local inshore vessels and larger vessels that operate further offshore and have homeports in the UK and other European countries.
- 3. This chapter is supported by *Appendix 13.1 Commercial Fisheries Technical Report*, where detailed information on the commercial fisheries baseline is provided.
- 4. Other chapters of the PEIR which cover impacts that are related to those addressed in this chapter include:
  - Chapter 10 Fish and Shellfish Ecology and
  - Chapter 14 Shipping and Navigation.
- 5. This chapter has been produced by Brown and May Marine Limited (BMM).

#### 13.2 Consultation

6. Consultation is a key driver of the Environmental Impact Assessment (EIA) process, and continues throughout the lifecycle of a project, from its initial stages through to consent and post-consent. To date, consultation regarding commercial fisheries has been conducted through the East Anglia ONE North Scoping Report (ScottishPower Renewables (SPR) 2017) and direct consultation with fisheries stakeholders. Feedback received through this process has been considered in preparing incorporated into the PEIR where appropriate and this chapter will be updated following the next stage of consultation for the final assessment submitted with the Development Consent Order (DCO) application. The key issues raised by consultees in relation to

- commercial fisheries in the Scoping Opinion (Planning Inspectorate 2017) and how these have been addressed in this chapter are described in *Table 13.1*.
- 7. Direct consultation carried out to date with fisheries stakeholders through face to face meetings, telephone calls and email correspondence is summarised in *Table 13.2.*
- 8. Consultation with fisheries stakeholders is on-going and will continue after submission of the PEIR.

**Table 13.1 Consultation Responses** 

|                           | Table 13.1 Consultation Responses      |  |   |  |
|---------------------------|--|--|---|--|
| Consultee                 | Date/<br>Document                      | Comment  | Response / where addressed in the PEIR  |  |
| The Planning Inspectorate | December<br>2017<br>Scoping<br>Opinion | The Scoping Report notes the loss or restricted access to traditional fishing grounds during construction and operation. This may have subsequent effects on alternative fishing grounds such as those which are fished by smaller vessels. The Inspectorate considers that an assessment on the impacts on commercial fisheries interests should be included within the ES  | Consideration has been given in this chapter to the potential impacts of loss or restricted access to fishing grounds and potential for associated displacement in respect of all fishing fleets active in the study area, including local small vessels (Section 13.6.1.2, Section 13.6.2.2 and 13.6.2.3). |  |
| The Planning Inspectorate | December<br>2017<br>Scoping<br>Opinion | The Scoping Report identified the potential need for safety zones around the offshore infrastructure. The Inspectorate considers that the EIA should ensure that a worst case of the extent of such zones should be assessed.  | The worst-case assumption parameters included in this assessment take account of the implications of the introduction of safety zones during construction/decommissioning and operation ( <i>Table 13.4</i> ).  |  |
| The Planning Inspectorate | December<br>2017<br>Scoping<br>Opinion | The EIA should acknowledge that the exclusion of certain types of fishing may make an area more productive for other types of fishing. Accordingly, the assessment of impacts associated with changes in fishing practice during the operational phase of the Proposed Development should include an assessment of potential impacts on fish stocks of commercial interest and the potential reduction or increase in such stocks that will result from the presence of the wind farm development and of any safety or buffer zones. | Potential impacts associated with changes in fishing activity on commercially exploited fish species are described in Chapter 10 Fish and Shellfish Ecology.  |  |

| Consultee                            | Date/<br>Document                      | Comment  | Response / where addressed in the PEIR   |
|--------------------------------------|--|--|--|
| The Planning Inspectorate            | December<br>2017<br>Scoping<br>Opinion | The cumulative impacts assessment in the ES should be undertaken in line with Advice Note 17, particularly in terms of determining those other developments to be included.  | Consideration has been given to Advice Note 17, for identification of projects included in the cumulative assessment.  |
| Marine<br>Management<br>Organisation | December<br>2017<br>Scoping<br>Opinion | The MMO advises that the EA1N project area does not support any nationally significant shellfisheries, although there is some potting for crabs, lobsters and whelks as well as some trawling for shrimps in the area.   | Noted.   |
| Marine<br>Management<br>Organisation | December<br>2017<br>Scoping<br>Opinion | Continuation of the established Commercial Fisheries Working Group is commended and the MMO encourages ongoing engagement with the fishing industry. The MMO welcomes the appointment of a Fisheries Liaison Officer, who will work closely with the fishing industry to help identify what mitigation may be required. The MMO notes that fishers in the southern North Sea have faced disruption from a number of developments in close proximity to the project area and the cumulative loss of fishing grounds, either temporarily or permanently, should be recognised. | Consideration has been given in this chapter to the potential for cumulative impacts on commercial fisheries to arise as a result of other projects in the wider area (Section 13.7).  |
| Marine<br>Management<br>Organisation | December<br>2017<br>Scoping<br>Opinion | Good practice has been outlined to ensure the fishing industry is well informed of the survey and construction works. At this stage the developer has not indicated exactly what mitigation will be required for impacts on shellfish populations, only that mitigation will be identified and agreed with stakeholders where required. The MMO considers this to be appropriate at pre-application stage for the proposed development but should be further clarified.  | A number of mitigation measures have been incorporated as part of the proposed East Anglia ONE North project (embedded mitigation) to minimise potential impacts on commercial fisheries receptors, including local vessels operating static gear that target shellfish species. These are described in Section 13.3.3.  In instances when fishing gear may need to be temporarily relocated due to construction activities, |

| Consultee                            | Date/<br>Document                      | Comment   | Response / where addressed in the PEIR  |
|--------------------------------------|--|---|---|
|                                      |  |   | appropriate evidence-based mitigation, as specified in the Fisheries Liaison Offshore Wind and Wet Renewables group (FLOWW) Guidelines (FLOWW, 2014; 2015) will be considered.  |
| Marine<br>Management<br>Organisation | December<br>2017<br>Scoping<br>Opinion | The MMO acknowledges that the developer has highlighted the likely under-representation of smaller vessels within official datasets and the importance of consultation with fishers as a result. Commercial shellfish in the EA1N project area will mostly be targeted by <10m shellfish vessels operating in the inshore area, including the inshore section of the cable corridor. The MMO advises that such vessels are likely to be more sensitive to impacts from construction activities owing to their limited range and ability to relocate to alternative fishing grounds. | Consultation has been undertaken with a wide range of fisheries stakeholders including skippers of local small vessels (see <i>Table 13.2</i> ).  |
| Marine<br>Management<br>Organisation | December<br>2017<br>Scoping<br>Opinion | The site will be 36km from Lowestoft and 42 km from Southwold. The MMO recommends that consideration is given in the ES to the cables being installed and the potential for cables to become exposed, which may impact upon trawling and other fishing activities.  | The potential impacts associated with the installation and operational phase of the cables have been taken account of in this chapter ( <i>Table 13.4 and Section 13.6</i> ).  As noted in <i>Section 13.3.3</i> , Post-lay and burial inspection surveys will be undertaken after the cables are installed into the seabed to assess the seabed status. In addition to burial status, these will identify the presence of construction related seabed obstacles and, where appropriate and practicable, rectification works would be undertaken. |
| Norfolk County<br>Council            | November<br>2017<br>Scoping            | The EIA/PEIR should consider the potential impact of the offshore scheme, including any underwater cable routes and other ancillary   | Consideration has been given in this chapter to the potential impacts of all offshore components of the proposed  |

| Consultee                 | Date/<br>Document                      | Comment  | Response / where addressed in the PEIR   |
|---------------------------|--|--|--|
|                           | Opinion                                | development, on Norfolk's commercial fishing interests. The EIA will need to consider the wider cumulative impacts taking into account existing operational wind farm; those under constructions; those consented and those in planning.   | East Anglia ONE North project ( <i>Table 13.4 and Section 13.6</i> ).  A wide range of projects and activities have been included in the cumulative impact assessment, including those under construction, consented and/or planned ( <i>Section 13.7</i> ).  Currently operational offshore windfarms are considered to form part of the existing baseline and therefore have not been included in the cumulative assessment ( <i>Section 13.7</i> ).   |
| Norfolk County<br>Council | November<br>2017<br>Scoping<br>Opinion | The EIA should set out appropriate mitigation, and where necessary indicate what compensation, will be given to those commercial fishing interests in Norfolk adversely impacted by the operation of the wind farm and/or ancillary development. In addition the PEI should provide an indication of the likely impact on the local fishing industry particularly when other proposals are taken into account. | Consideration has been given throughout the assessments presented in this chapter (including the cumulative assessment) to potential impacts on all fleets known to be active in the study area, including the local inshore fleet (Section 13.6 and Section 13.7).  A number of mitigation measures have been incorporated as part of the proposed East Anglia ONE North project (embedded mitigation) to minimise potential impacts on commercial fisheries receptors, including local vessels. These are described in Section 13.3.3.  Subject to the findings of the impact assessment, cooperation mechanisms (where required) will be implemented with reference to the following FLOWW Guidelines (FLOWW 2014; 2015). |

|                            |   | Consultation meeting not arranged                      |

9. Ongoing public consultation has been conducted through a series of Public Information Days (PIDs) and Public Meetings. PIDs have been held throughout Suffolk in November 2017, March 2018, and June / July 2018 with further events planned in 2019. A series of stakeholder engagement events were also undertaken in October 2018 as part of consultation phase 3.5. These events were held to inform the public of potential changes to the onshore substation

location. This consultation aims to ensure that community concerns are well understood and that site specific issues can be taken into account, where practicable. Consultation phases are explained further in *Chapter 5 EIA Methodology*. *Table 13.3* shows public consultation feedback pertaining to commercial fisheries. Consultation phases are explained further in *Chapter 4 Site Selection and Assessment of Alternatives*. Full details of the proposed East Anglia ONE North project consultation process will be presented in the Consultation Report, which will be submitted as part of the DCO application.

Table 13.3 Consultation Responses relevant to Commercial Fisheries

| Topic |   | Response / where addressed in the PEI   |
|-------|---|---|
| Phase | 1   |   |
| •     | Effects on commercial fisheries  Rock dumping interfering with trawling activities                          | Potential impacts on commercial fisheries are assessed in <b>section 13.6</b>   |
| Phase | 2   |   |
| •     | Fishing activity affected by piling  Construction of offshore cable corridor in fishermen's pulling grounds | Potential impacts on fishing activity during the construction phase are assessed in <b>section 13.6.1</b>   |
| Phase | 3   |   |
| None  |   | n/a   |
| Phase | 3.5   |   |
| •     | Impact on fishing industry – compensation necessary   | The requirement for any compensatory agreements between the Applicant and fishermen will be determined post consent through the established Commercial Fisheries Working Group. |

### 13.3 Scope

### 13.3.1 Study Area

10. The offshore development area is located in International Council for the Exploration of the Sea (ICES) Division IVc (Southern North Sea). Fisheries data and information within each ICES Division are collected and analysed by ICES statistical rectangle. The study area used for assessment of commercial fisheries activity has therefore been defined with reference to the ICES rectangles within which the offshore development area falls (*Figure 13.1*). These are as follows:

- ICES rectangle 33F1, where the inshore section of the offshore cable corridor is located, and
- ICES rectangle 33F2, where the offshore section of the offshore cable corridor and the East Anglia ONE North windfarm site are located.
- 11. The study area defined above has been used to identify fisheries active in areas relevant to the proposed East Anglia ONE North project and the levels of fishing that the offshore development area sustains. Where relevant, however, data and information have been analysed from wider areas to provide context and describe the full extent of the fishing activity of the fleets identified.

#### 13.3.2 Worst Case

- 12. The design of the proposed East Anglia ONE North project (including number of wind turbines, layout configuration, requirement for scour protection, electrical design, etc.) is not yet fully determined, and may not be known until sometime after the DCO has been granted. Therefore, in accordance with the requirements of the Project Design Envelope (also known as the Rochdale Envelope) approach to EIA (Planning Inspectorate 2018) (as discussed in *Chapter 5 EIA Methodology*), realistic worst case scenarios in terms of potential effects upon commercial fisheries are adopted to undertake a precautionary and robust impact assessment
- 13. The worst case scenarios used for assessment of the potential impacts of the proposed East Anglia ONE North project with regards to commercial fisheries are presented in *Table 13.4*. These take account of the project design envelope described in *Chapter 6 Project Description* and the embedded mitigation measures identified in respect of commercial fisheries (see *Section 13.3.3*).

Table 13.4 Worst Case Assumptions

| Impact   | Parameter  | Rationale  |  |
|--|--|--|--|
| Construction   |  |  |  |
| Adverse impacts on commercially exploited fish and shellfish species | Worst case assumption parameters in respect of fish and shellfish species during construction, including those of commercial importance, are provided in <i>Chapter 10 Fish and Shellfish Ecology.</i>   |  |  |
| Temporary loss or restricted access to traditional fishing grounds.  | Rolling 500m safety zones around construction works, 50m safety zones around installed or partially installed infrastructure and 500m advisory safety zones along exposed sections of cables (i.e. cables awaiting burial or protection). This would lead to a theoretical worst case under which all fishing activities would be excluded from the entirety of the East Anglia TWO windfarm site and the offshore cable corridor towards the latter stages of construction. | This represents the maximum duration and extent of potential fishing exclusion throughout the construction phase and hence the greatest potential to restrict access to fishing grounds.                       |  |
|  | Offshore construction works occurring over an approximate 27-month window.   |  |  |
| Displacement of fishing activity into other areas                    | As described above for temporary loss or restricted access to traditional fishing grounds.   | Represents the maximum duration and extent of fishing exclusion throughout the construction phase and hence the greatest potential for displacement of fishing activity into other areas.                      |  |
| Increased steaming times to fishing grounds                          | Presence of 500m safety zones around construction works and 50m safety zones around installed or partially installed infrastructure over the course of the 27-month construction period.   | Represents the maximum potential disruption to established steaming routes.  |  |
| Interference with fishing activity (navigational conflict)           | Maximum of 74 construction vessels simultaneously operating on site  Maximum number of vessel trips during the construction phase: 3,335  Assumes that construction vessel transit routes overlap with fishing grounds   | The maximum duration of offshore construction activity, maximum number of vessels on site at any one time and maximum number of vessel transits during construction would result in the greatest potential for |  |

| Impact                            | Parameter  | Rationale  |
|-----------------------------------|--|--|
|                                   | Approximate duration of offshore construction activity of 27 months  | interference with towed / static fishing gear.   |
| Safety issues for fishing vessels | Safety issues as a result of potential interactions between fishing vessels, fishing gear and cables:  Maximum length of cables:  Inter-array cables: 200km;  Platform link cables: 75km; and  Export cables: 152km (2 cables 76km each).  Assumes cables will be surface laid before being buried/protected;  Maximum length of cables requiring cable protection:  Inter-array cables: 24.8km (cable crossings, entry to substation/turbine and unburied due to soil uncertainties);  Platform link cables: 10% of their length (7.5km) due to ground conditions and protection at up to 49 crossings (160m per crossing); and  Export cables: 10% of their length (15.2km) due to ground conditions and protection at up to 34 crossings (160m per crossing).  Safety risks as a result of potential Interactions between fishing vessels and gear and project infrastructure:  Manoeuvrability and snagging risk issues associated with the presence of installed and partially installed infrastructure as a result of the installation of:  Up to 67 wind turbines (minimum spacing between turbines: (minimum spacing between turbines | Given the large number of cables, crossings, wind turbines, platforms etc covering much of the site and export cable route, the worst case assumes the potential for safety issues (e.g. snagging and manoeuvrability risks) across the offshore development area. |

| Impact   | Parameter   | Rationale   |  |
|--|---|---|--|
|  | Up to 4 offshore electrical platforms;  |   |  |
|  | Up to 1 construction, operation and maintenance platform; and   |   |  |
|  | Up to 1 met mast.   |   |  |
|  | Safety issues for fishing vessels associated with the potential for collision with construction vessels and allision with infrastructure are described and assessed in <b>Chapter 14 Shipping and Navigation</b> .  |   |  |
| Seabed obstacles   | Offshore works such as construction anchoring, jack up legs or cable trenching can produce seabed obstructions which can represent a potential fastening risk and damage to fishing gears.  Potential for objects to be dropped on the seabed during construction related activities. | The presence of seabed obstacles may result in potentially unacceptable safety risks to fishing vessels |  |
| Operation  |   |   |  |
| Adverse impacts on commercially exploited fish and shellfish species | Worst case assumption parameters in respect of fish and shellfish species during operation, including those of commercial importance, are provided in <i>Chapter 10 Fish and Shellfish Ecology</i> .  |   |  |
| Complete loss or restricted access to                                | Maximum area lost/restriction to fishing as a result of the following:  | This represents the greatest extent of potential fishing exclusion throughout                           |  |
| traditional fishing grounds  | Up to 67 wind turbines;   | the operation phase and hence the greatest potential to restrict access to                              |  |
|  | Up to 4 offshore electrical platforms;  | fishing grounds.  |  |
|  | Up to 1 construction, operation and maintenance platform; and   |   |  |
|  | Up to 1 met mast.   |   |  |
|  | Safety zones of 500m around major operation and maintenance works;  |   |  |
|  | Maximum length of cables:   |   |  |

| Impact  | Parameter   | Rationale   |
|---|---|---|
|   | <ul> <li>Inter-array cables: 200km;</li> <li>Platform link cables: 75km; and</li> <li>Export cables: 152km (2 cables 76km each).</li> <li>Minimum spacing between turbines: 1,200m inter-row and 800m in-row</li> <li>Cables will be buried to a minimum of 0.5m where possible and protected where burial is not possible (i.e. due to hard ground or at cable crossings);</li> <li>Maximum length of cables requiring protection:         <ul> <li>Inter-array cables: 24.8km (cable crossings, entry to substation/turbine and unburied due to soil uncertainties);</li> <li>Platform link cables: 10% of their length (7.5km) due to ground conditions and protection at up to 49 crossings (160m per crossing); and</li> </ul> </li> <li>Export cables: 10% of their length (15.2km) due to ground conditions and protection at up to 34 crossings (160m per crossing).</li> </ul> |   |
| Displacement of fishing activity into other areas | As above for impact of complete loss or restricted access to traditional fishing grounds  | This represents the greatest extent of potential fishing exclusion throughout the operation phase hence the greatest potential for displacement of fishing activity into other areas. |
| Increased steaming times to fishing grounds       | Presence of the following:  Up to 67 wind turbines;  Up to 4 offshore electrical platforms;  Up to 1 construction, operation and maintenance platform; and  | Results in the maximum potential disruption to established steaming routes.   |

| Impact   | Parameter  | Rationale   |
|--|--|---|
|  | <ul> <li>Up to 1 met mast.</li> <li>Safety zones of 500m around major operation and maintenance works;</li> <li>Minimum spacing between turbines: 800m in-row and 1,200m inter-row</li> </ul>  |   |
| Interference with fishing activity (navigational conflict) | Up to 647 vessel round trips per year  Assumes transit routes cross mobile and static gear fishing grounds.  | The maximum number of vessel transits during operation and maintenance results in the greatest potential for conflict between operation and maintenance vessels and fishing gear. |
| Safety issues for fishing vessels                          | <ul> <li>Safety risks as a result of potential interactions between fishing vessels and gear and cables:</li> <li>Maximum length of cables (as above for complete loss or restricted access to fishing grounds);</li> <li>Cables buried to a minimum depth of 0.5m and protected where burial is not possible (i.e. due to hard ground or at cable crossings);</li> <li>Maximum extent of cables requiring protection (as above for complete loss or restricted access to fishing grounds)</li> <li>Safety risks as a result of potential Interactions between fishing vessels and gear and project infrastructure:</li> <li>Manoeuvrability and snagging risk issues associated with the presence of installed infrastructure (as above for Safety issues for fishing vessels in the construction phase).</li> <li>Safety issues for fishing vessels associated with the potential for collision with operation vessels and infrastructure are detailed and assessed in <i>Chapter 14 Shipping and Navigation</i>.</li> </ul> | The maximum scenario for potential causes of fishing vessel collision and gear snagging which could lead to safety risks  |

| Impact   | Parameter   | Rationale   |
|--|---|---|
| Seabed obstacles   | Presence of obstacles on the seabed that may represent a fastening/safety risk to fishing vessels   | Presence of obstacles on the seabed with potential to result in unacceptable risks to fishing vessels     |
| Decommissioning  |   |   |
| As decommissioning sched analogous with those asses                    | ules and methodologies are not available, decommissioning works and implications for commesed for construction.   | nercial fisheries are considered  |
| Cumulative   |   |   |
| Potential impacts on commercially exploited fish and shellfish species | See Chapter 10: Fish and Shellfish Ecology  |   |
| Complete loss or restricted access to traditional fishing grounds      | Full development of relevant proposed marine developments (Section 13.7)  | This could result in the maximum restriction to the resumption of normal fishing activities               |
| Displacement of fishing activity in other areas                        | Full development of relevant proposed marine developments   | This has the highest potential to confine the continuation of normal fishing activities within the region |
| Increased steaming times to fishing grounds                            | Full development of relevant proposed marine developments   | This could potentially cause the maximum increase to steaming times to fishing grounds                    |
| Interference with fishing activity (navigational conflict)             | Full development of relevant proposed marine developments   | This represents the highest potential risk of conflict for fishing vessels                                |
| Safety issues for fishing vessels                                      | It is considered that the same obligations discussed for the proposed East Anglia ONE Nor issues are kept within acceptable limits would apply to other projects / activities, therefore impacts to occur in this respect. As such safety issues for fishing vessels are not discusse | negating the potential for cumulative   |

| Impact           | Parameter                      | Rationale  |
|------------------|--------------------------------|--|
| Seabed obstacles | associated with sea bed obstac | oligations discussed for the proposed East Anglia ONE North project alone to ensure safety issues es are kept within acceptable limits would apply to other projects / activities, therefore negating the to occur in this respect. As such safety issues for fishing vessels are not discussed further in the |

#### 13.3.3 Embedded Mitigation

- 14. Where applicable, relevant mitigation measures are incorporated as part of the proposed East Anglia ONE North project design process and are referred to as embedded mitigation. The embedded mitigation measures relevant to commercial fisheries are considered when assessing potential impacts to receptors and are described below.
- 15. The Applicant is committed to working closely with commercial fisheries stakeholders. The appropriate liaison will be undertaken with all relevant fishing interests to ensure they are fully informed of all construction, maintenance and decommissioning activities. In order to ensure and maintain regular communication, a Commercial Fisheries Working Group (CFWG) has been established to cover liaison in respect to East Anglia ONE, East Anglia THREE, East Anglia TWO and East Anglia ONE North. The CFWG has a representative from each local port which could potentially be impacted by the proposed East Anglia ONE North project (Orford, Aldeburgh, Harwich, Felixstowe, Lowestoft and Southwold). Based on the available fisheries statistics and information provided during consultation, it is considered that vessels fishing from areas further north of Lowestoft do not regularly fish in the study area, therefore these ports are not represented on the CFWG.
- 16. The CFWG aims to identify and develop co-existence strategies during a project's lifecycle. A Co-existence and Fisheries Liaison Plan will be produced for the proposed East Anglia ONE North project, post-consent. It is expected that the CFWG will also be used to discuss any mitigation necessary for the proposed East Anglia TWO project where appropriate.
- 17. The Applicant has appointed a Fisheries Liaison Officer (FLO) to work with the fishing industry across all East Anglia projects including the proposed East Anglia ONE North project. This ensures consistency in the approach to consultation and liaison between SPR projects, and the continuation of the productive working relationship established with commercial fisheries stakeholders to date.
- 18. In order to assess the sea bed status, post-lay and burial inspection surveys may be undertaken after cable installation. It is anticipated that a cable burial plan will be required as part of the Deemed Marine Licence. Within this plan there will be an agreed protocol for monitoring of post-installation cable burial if required. Additionally, the construction of the project will be undertaken against an agreed 'dropped objects procedure' that will require the Applicant to notify the MMO of any dropped objects and agreement over their recovery, where required. The Co-existence and Fisheries Liaison Plan, discussed above, will also include protocols for the 'snagging' or loss/damage of fishing gear associated with the project infrastructure.

- 19. Timely and efficient Notices to Mariners (NtMs), Kingfisher and other navigational warnings will be issued to the fishing industry prior to all survey and construction works through a project specific marine co-ordination system.
- 20. The UK Hydrographic Office (UKHO) will be informed of both the progress and completion of the proposed windfarm.

#### 13.3.4 Monitoring

21. Post-consent, the final detailed design of the proposed East Anglia ONE North project and the development of the relevant management plan(s) will refine the worst-case parameters assessed in the EIA. It is recognised that monitoring is an important element in the management and verification of the impacts of the proposed East Anglia ONE North project. Outline management plans, across a number of environmental topics, will be submitted with the DCO application. These outline management plans will contain key principles that provide the framework for any monitoring that could be required. The requirement for and final appropriate design and scope of monitoring will be agreed with the relevant stakeholders and included within the relevant management plan(s), submitted for approval, prior to construction works commencing.

### 13.4Assessment Methodology

### 13.4.1 Guidance and Legislation

22. The assessment of potential impacts on commercial fisheries as a result of the proposed East Anglia ONE North project has been undertaken with specific reference to relevant National Policy Statements (NPS) (*Table 13.5*).

Table 13.5 National Policy Statement (NPS) for Renewable Energy Infrastructure (EN-3)

| NPS Guidance  | NPS Reference        | Where addressed in PEI   |
|---|----------------------|--|
| The construction and operation of offshore windfarms can have both positive and negative effects on fish and shellfish stocks.  | EN-3 section 2.6.122 | The potential impacts of the proposed East Anglia ONE North project on fish and shellfish species, including those of commercial importance, is presented in <i>Chapter 10 Fish and Shellfish Ecology</i> . In order to inform this chapter, reference has been made to the findings of <i>Chapter 10 Fish and Shellfish Ecology</i> where relevant. |
| Whilst the footprint of the offshore windfarm and any associated infrastructure may be a hindrance to certain types of commercial fishing activity such as trawling and longlining, other fishing activities may be able to take place within operational | EN-3 section 2.6.123 | Consideration has been given within this chapter to the potential for the presence of project infrastructure to result in loss or restricted access to fishing grounds and potential for displacement on a fleet by fleet basis (Section 13.6.1.2 and Section 13.6.2.2).   |

| NPS Guidance  | NPS Reference        | Where addressed in PEI   |
|---|----------------------|--|
| windfarms without unduly disrupting or compromising navigational safety. Consequently, the establishment of a windfarm can increase the potential for some fishing activities, such as potting, where this would not compromise any safety zone in place. The Planning Inspectorate should consider adverse or beneficial impacts on different types of commercial fishing on a case by case basis. |                      |  |
| In some circumstances, transboundary issues may be a consideration as fishermen from other countries may fish in waters within which offshore windfarms are sited.  | EN-3 section 2.6.124 | Consideration has been given in this chapter to the potential impacts of the proposed East Anglia ONE North project on UK and non-UK fleets (Section 13.4.5 Section 38, Section 13.6 and Section 13.7).  |
| Early consultation should be undertaken with statutory advisors and with representatives of the fishing industry which could include discussion of impact assessment methodologies. Where any part of the proposal involves a grid connection to shore, appropriate inshore fisheries groups should be consulted.   | EN-3 section 2.6.127 | To date consultation with regards to commercial fishing has been carried out through the Scoping exercise and via direct consultation with statutory and non-statutory fisheries stakeholders, including individual local fishermen that target inshore areas relevant to the offshore cable corridor ( <i>Table 13.2</i> ). |
| Where a number of offshore windfarms have been proposed within an identified zone, it may be beneficial to undertake such consultation at a zonal, rather than a site specific, level.  | EN-3 section 2.6.128 | A zonal approach to consultation was taken as part of the East Anglia Round 3 Zonal Appraisal and Planning (ZAP) process. <b>Section 13.2</b> describes stakeholder consultation which has been undertaken to inform this chapter.   |
| The assessment by the applicant should include surveys of the effects on fish stocks of commercial interest and any potential reduction in such stocks, as well as any likely constraints on fishing activity within the project boundaries.  | EN-3 section 2.6.129 | A detailed assessment of the impacts of the proposed East Anglia ONE North project on fish and shellfish receptors is provided in <i>Chapter 10 Fish and Shellfish Ecology</i> . This takes account of the results of fish surveys carried out in the area.  The likely constraints on fishing associated                    |

| NPS Guidance   | NPS Reference        | Where addressed in PEI  |
|--|----------------------|---|
| Robust baseline data should have been collected and studies conducted as part of the assessment.   |                      | with the proposed East Anglia ONE North project are considered in the assessment presented in <b>Section 13.6 and Section 13.7</b> within this chapter.   |
| Where there is a possibility that safety zones will be sought around offshore infrastructure, potential effects should be included in the assessment on commercial fishing.  | EN-3 section 2.6.130 | Consideration has been given in the assessment presented in <b>Section 13.6 and Section 13.7</b> to the implication of the implementation of safety zones on commercial fisheries receptors.  |
| Where the precise extents of potential safety zones are unknown, a realistic worst case scenario should be assessed.  Applicants should consult the MCA. Exclusion of certain types of fishing may make an area more productive for other types                        | EN-3 section 2.6.131 | Consideration has been given to the implementation of advisory safety zones for definition of the worst-case scenario ( <i>Table 13.4</i> ) and assessment of potential impacts on commercial fisheries ( <i>Section 13.6 and Section 13.7</i> ).   |
| of fishing. The assessment by the applicant should include surveys of the effects on fish stocks of commercial interest and the potential reduction or increase in such stocks that will result from the presence of the windfarm development and of any safety zones. |                      | Consideration is given in this assessment to the potential impacts of the proposed East Anglia ONE North project on commercially exploited fish and shellfish populations (Section 13.6 and Section 13.7). A detailed assessment of the impacts of the proposed East Anglia ONE North project on fish and shellfish species, including those of commercial importance, is provided in Chapter 10 Fish and Shellfish Ecology |

- 23. In addition to the NPS guidance, the following guidance documents have been used to inform the assessment of potential impacts on commercial fisheries:
  - Centre for Environment, Fisheries and Aquaculture Science (Cefas) (2012)
     Guidelines for data acquisition to support marine environmental assessments of offshore renewable energy projects. Contract report: ME5403, May 2012;
  - Cefas, Marine Consents and Environment Unit (MCEU), Department for Environment, Food and Rural Affairs (DEFRA) and Department of Trade and Industry (DTI) (2004) Offshore Wind Farms - Guidance note for Environmental Impact Assessment In respect of FEPA and CPA requirements, Version 2;

- RenewableUK (2013) Cumulative impact assessment guidelines, guiding principles for cumulative impacts assessments in offshore windfarms;
- Sea Fish Industry Authority and UK Fisheries Economic Network (UKFEN)
   (2012) Best practise guidance for fishing industry financial and economic impact assessments;
- Blyth-Skyrme, R.E. (2010) Options and opportunities for marine fisheries mitigation associated with windfarms. Final report for Collaborative Offshore Wind Research into the Environment contract FISHMITIG09. COWRIE Ltd. London:
- FLOWW Best Practice Guidance for Offshore Renewables Developments.
   Recommendations for Fisheries Liaison. FLOWW (2014);
- FLOWW Best Practice Guidance for Offshore Renewables Developments: Recommendations for Fisheries Disruption Settlements and Community Funds. FLOWW ,(2015);
- UK Oil and Gas (2015) Fisheries Liaison Guidelines Issue 6; and
- International Cable Protection Committee (2009) Fishing and Submarine Cables - Working Together.

#### 13.4.2 Data Sources

24. The principal sources of data and information used to inform this chapter are outlined in *Table 13.6*. A detailed description of these can be found in *Appendix 13.1 Commercial Fisheries Technical Report.* 

**Table 13.6 Data Sources** 

| Data type  | Source | Year                      | Description   |
|--|--------|---------------------------|---|
| Fisheries<br>Statistics<br>(landings<br>values and<br>fishing<br>effort) | MMO    | 2012 to 2016 <sup>1</sup> | Landings value and effort data for UK vessels landing into UK and European ports and non-UK vessels landing into UK ports.  |
| Surveillance<br>Sightings  | ММО    | 2011 to 2015 <sup>2</sup> | Sightings of vessels recorded in UK waters, providing location, nationality and fishing method information. Data is collected by weekly surveillance fly overs during daylight hours. |
| Vessel<br>Monitoring   | ММО    | 2012 to 2016              | Satellite tracking of all UK fishing vessels over 15m in Europoean waters. Data are cross-  |

<sup>&</sup>lt;sup>1</sup> Data for 2017 are not yet available for public/private release by the MMO and will not be available until Autumn 2018.

<sup>&</sup>lt;sup>2</sup> Given the limitations of the MMO 2016 surveillance sightings dataset (no sightings recorded in the study area for that year) surveillance sightings data have been analysed only up to 2015 (see Appendix 14.1, Annex 3 for further detail)

| Data type   | Source  | Year         | Description   |
|---|---|--------------|---|
| System<br>(VMS) Data  |   |              | referenced with landings information to provide data at 0.05° by 0.05° scale.   |
| Fisheries<br>Statistics<br>(landings<br>value and<br>effort data) | Belgian Institute<br>for Agricultural<br>and Fisheries<br>Research<br>(ILVO)                            | 2010 to 2014 | Landings values (€) and effort of all over-10m Belgian fishing vessels.   |
| VMS Data  | Belgian ILVO  | 2010 to 2014 | Satellite tracking for over-15m Belgian vessels. The data has been filtered by speed to eliminate transiting vessels.   |
| VMS Data  | Netherlands,<br>Institute for<br>Marine<br>Resources and<br>Ecosystem<br>Studies<br>(IMARES) and<br>LEI | 2012 to 2016 | Satellite tracking of Dutch fishing vessels combined with logbook data for Dutch fishing vessels in the North Sea. A grid is defined based on 1/16th of an ICES rectangle. The data is filtered by speed. |
| Fisheries<br>Statistics<br>(landings<br>value and<br>effort data) | IMARES  | 2012 to 2016 | Landings value and effort data for over 10m Dutch vessels landing into Europoean ports.   |
| VMS data  | Comité Nationale des Pêches Maritimes et des Élevages Marins (CNPMEM)                                   | 2008         | VMS charts by fishing effort (hours)  |
| Fishing<br>Effort Data  | IFREMER   | 2014         | Fishing effort (days) charts for the Central (IVb) and Southern North Sea (IVc).  |
| VMS data  | German<br>Federation of<br>Agriculture and<br>Food  | 2007 to 2012 | Satellite tracking by vessel density in the North Sea.  |
| VMS data  | Danish<br>Ministeriet for<br>Fødevarer,<br>Landbrug og<br>Fiskeri (MFLF)                                | 2011 to 2015 | VMS effort data (days) for Danish fishing vessels in the North Sea.   |

25. Further to analysis of the fisheries datasets described in *Table 13.6*, information gathered through consultation with fisheries stakeholders (*Table 13.2*) has also been used to inform this chapter, including information on fishing grounds, operating practices, vessel and gear specifications as well as key concerns in relation to the proposed East Anglia ONE North project.

#### 13.4.3 Impact Assessment Methodology

- 26. The assessment of the potential impacts of the proposed East Anglia ONE North project on commercial fisheries receptors considers relevant aspects specified in the Cefas and MCEU (2004) guidelines for offshore wind developments and takes account of the feedback received during consultation with fisheries stakeholders.
- 27. The impact assessment is presented separately for the construction, operation and decommissioning phase for each potential impact. In addition, it considers potential cumulative and transboundary impacts.
- 28. The assessment is undertaken on a fleet by fleet basis, taking account of the nationalities and fishing methods identified in the study area from consultation and analysis of fisheries data and information.
- 29. Where inter-relations with other topics may occur, the outcomes of the assessments carried out in other chapters are cross referenced as required. As previously mentioned, other PEIR chapters that provide information and assessments of relevance to commercial fisheries are *Chapter 10 Fish and Shellfish Ecology* and *Chapter 14 Shipping and Navigation*.

#### 13.4.3.1 Sensitivity

30. The criteria used to define the sensitivity of commercial fisheries receptors are provided in *Table 13.7.* 

Table 13.7 Definitions of the Different Sensitivity Levels for Commercial Fisheries Receptors

| Sensitivity | Definition   |
|-------------|--|
| High        | Limited operational range and ability to deploy only one gear type.  High dependence upon a single fishing ground.                                   |
| Medium      | Moderate extent of operational range and / or ability to deploy an alternative gear type.  Dependence upon a limited number of fishing grounds.      |
| Low         | Extensive operational range and / or ability to deploy a number of gear types or to modify gears.  Ability to fish a number of fishing grounds.      |
| Negligible  | Extensive operational range and very high method versatility in terms of gear types.  Vessels are able to exploit a large number of fishing grounds. |

#### 13.4.3.2 Magnitude

- 31. The criteria used to define impact magnitude on commercial fisheries are provided in *Table 13.8*.
- 32. The magnitude of an effect is considered for each predicted impact on an individual fleet basis and is defined taking account of the spatial and temporal extent of the impact. This is considered in the context of the relative level of importance to each fleet of the area affected by the potential impact (i.e. the level of fishing in the area with reference to the extent of alternative grounds that the fleet is able to exploit).
- 33. With respect to the duration of potential impacts, those which relate to construction are considered to be short to medium term; with the overall offshore construction programme for the proposed East Anglia ONE North project anticipated to be 27 months (see **Section 13.3.2**). Impacts associated with operation are longer term, throughout the operational life of the proposed East Anglia ONE North project.

Table 13.8 Definitions of the Magnitude Levels for a Commercial Fisheries Receptor

| Value      | Definition   |
|------------|--|
| High       | The area affected by the impact sustains high levels of activity by the fleet and covers a large or moderate extent of its grounds; and/or The effect is permanent.        |
| Medium     | The area affected by the impact sustains moderate/high levels of activity by the fleet and covers a small/moderate extent of its grounds; and/or The effect is long term.  |
| Low        | The area affected by the impact sustains low/moderate levels of activity by the fleet and covers a small extent of its grounds; and/or The effect is short to medium term. |
| Negligible | The area affected by the impact sustains low/ negligible activity by the fleet and covers a small/negligible extent of its grounds; and/or The effect is short term.       |

#### 13.4.3.3 Impact Significance

- 34. The significance of an impact is identified taking account of the magnitude of effect and the sensitivity of the receptor following the impact significance matrix shown in *Table 13.9*. On this basis potential impacts are assessed as of negligible, minor, moderate or major significance. Those impacts which are of moderate or major significance are considered significant in Environmental Impact Assessment (EIA) terms. Impact significance definitions are provided in *Table 13.10*.
- 35. It should be noted that the definition of impact significance, whilst guided by the significance criteria matrix (*Table 13.9*), is largely qualitative and based on professional judgement.

**Table 13.9 Impact Significance Matrix** 

| Table       | Tolo IIII pac | Negative Magnitude |            |            | Beneficial Magnitude |            |            |            |          |
|-------------|---------------|--------------------|------------|------------|----------------------|------------|------------|------------|----------|
|             |               | High               | Medium     | Low        | Negligible           | Negligible | Low        | Medium     | High     |
|             | High          | Major              | Major      | Moderate   | Minor                | Minor      | Moderate   | Major      | Major    |
| tivity      | Medium        | Major              | Moderate   | Minor      | Minor                | Minor      | Minor      | Moderate   | Major    |
| Sensitivity | Low           | Moderate           | Minor      | Minor      | Negligible           | Negligible | Minor      | Minor      | Moderate |
|             | Negligible    | Minor              | Negligible | Negligible | Negligible           | Negligible | Negligible | Negligible | Minor    |

**Table 13.10 Impact Significance Definitions** 

| Value      | Definition   |
|------------|--|
| Major      | Very large or large change to fishing activity and/or fishing opportunities for a given receptor.    |
| Moderate   | Intermediate change to fishing activity and/or fishing opportunities for a given receptor.           |
| Minor      | Small change to fishing activity and/or fishing opportunities for a given receptor.                  |
| Negligible | No discernible change to fishing activity and/or fishing opportunities for a given receptor.         |
| No change  | No impact, therefore no change to fishing activity and/or fishing opportunities for a given receptor |

#### 13.4.3.4 Safety Risks

36. Where the proposed East Anglia ONE North project poses a potential safety risk to fishing vessels and crews, the significance criteria outlined previously are not considered appropriate. In these instances, impacts are assessed in terms of potential risks in line with the parameters used in *Chapter 14 Shipping and Navigation* (see *Table 13.11*).

Table 13.11 Impact Significance Matrix (Source: Chapter 14 Shipping and Navigation)

| Frequency              |                       |                       |                       |                       |              |
|------------------------|-----------------------|-----------------------|-----------------------|-----------------------|--------------|
| Frequent               | Tolerable             | Tolerable             | Unacceptable          | Unacceptable          | Unacceptable |
| Reasonably<br>Probable | Broadly<br>Acceptable | Tolerable             | Tolerable             | Unacceptable          | Unacceptable |
| Remote                 | Broadly<br>Acceptable | Broadly<br>Acceptable | Tolerable             | Tolerable             | Unacceptable |
| Extremely<br>Unlikely  | Broadly<br>Acceptable | Broadly<br>Acceptable | Broadly<br>Acceptable | Tolerable             | Tolerable    |
| Negligible             | Broadly<br>Acceptable | Broadly<br>Acceptable | Broadly<br>Acceptable | Broadly<br>Acceptable | Tolerable    |
|                        | Negligible            | Minor                 | Moderate              | Serious               | Major        |
|                        | Severity              |                       |                       |                       |              |

#### 13.4.4 Cumulative Impact Assessment

37. Projects / activities which have been considered in the cumulative assessment have been selected on the basis of the level of available information and their proximity to the proposed East Anglia ONE North project. Given the extent of the operational range of some of the fleets active in areas relevant to the

proposed East Anglia ONE North project, projects/activities located in the North Sea and the English Channel have been included for assessment of cumulative impacts (see **Section 13.7**).

#### 13.4.5 Transboundary Impact Assessment

38. The potential impacts on both UK and foreign fleets are taken into account in this impact assessment. Transboundary impacts are therefore integrated within the impact assessment.

### 13.5 Existing Environment

#### 13.5.1 Overview

- 39. An overview of the principal fishing fleets and methods operating in the study area is given in this section based on analysis of MMO surveillance sightings from 2011 to 2015 by method and nationality (*Table 13.12*, *Figure 13.2* and *Figure 13.3*).
- 40. In rectangle 33F1, where the inshore section of the offshore cable corridor is located, most surveillance sightings are of UK vessels, principally potters/whelkers, followed by trawlers, long liners and netters. French trawlers and Belgian beam trawlers have also been observed in this inshore rectangle in some numbers with vessels from other nationalities showing negligible records. In this context it is important to note that both French and Belgian vessels hold historic fishing rights within this rectangle, being allowed to fish within the UK's 6 and 12nm limit in this area (*Figure 13.4*).
- 41. In rectangle 33F2, where the offshore section of the offshore cable corridor and the East Anglia ONE North windfarm site are located, the majority of surveillance sightings are of Dutch and Belgian vessels, primarily beam trawlers and trawlers (unspecified).
- 42. Albeit at comparatively lower levels, sightings of vessels from various other nationalities have also been recorded in the study area in areas beyond the UK's12nm limit, particularly German beam trawlers and Danish trawlers (*Table 13.12*).

Table 13.12 Surveillance sightings from 2011 to 2015 (MMO, 2018) by vessel nationality and method in the study area

| ICES Rectangle | Nationality    | Fishing method | Number<br>of<br>sightings | Percentage<br>of sightings<br>for ICES<br>rectangle |
|----------------|----------------|----------------|---------------------------|---|
| 33F1 United Ki | United Kingdom | Potter/whelker | 59                        | 24.6  |
|                |                | Trawler (all)  | 37                        | 15.4  |

| ICES Rectangle | Nationality    | Fishing method         | Number<br>of<br>sightings | Percentage<br>of sightings<br>for ICES<br>rectangle |
|----------------|----------------|------------------------|---------------------------|---|
|                |                | Stern trawler          | 24                        | 10.0  |
|                |                | Beam Trawler           | 17                        | 7.1   |
|                |                | Long liner             | 13                        | 5.4   |
|                |                | Gill netter            | 11                        | 4.6   |
|                |                | Demersal stern trawler | 8                         | 3.3   |
|                |                | Scallop dredger        | 4                         | 1.7   |
|                |                | Trio Trawler           | 2                         | 0.8   |
|                |                | Rod and line           | 1                         | 0.4   |
|                |                | Unspecified            | 13                        | 5.4   |
|                |                | All methods            | 189                       | 78.8  |
|                | France         | Stern trawler          | 4                         | 1.7   |
|                |                | Trawler (all)          | 19                        | 7.9   |
|                |                | All methods            | 23                        | 9.6   |
|                | Belgium        | Beam trawler           | 22                        | 9.2   |
|                | Netherlands    | Beam trawler           | 4                         | 1.7   |
|                | Denmark        | Beam trawler           | 1                         | 0.4   |

#### 13.5.2 Dutch Fishing Vessels

#### 13.5.2.1 Overview

- 43. The principal fishing activity undertaken by Dutch vessels in the study area is beam trawling for flatfish species such as sole *Solea solea* and plaice *Pleuronectes platessa*. Dutch seine netters are also active, however to a much lesser extent (*Figure 13.5* and *Figure 13.6*). As described in *Appendix 13.1*, other fishing methods used by the Dutch fleet in the Southern North Sea are recorded at very low levels in the study area.
- 44. Dutch fishing vessels have no historic fishing rights within the 6 and 12nm limit off the East Anglian coast. Therefore, the areas of the offshore development area of relevance to the Dutch fleet are the sections of the offshore cable corridor located beyond the 12nm limit and the East Anglia ONE North windfarm site.

### 13.5.2.2 Dutch Beam Trawling

- 45. There has been a progressive conversion from the use of traditional beam trawls to the use of pulse wing trawls over the last ten years amongst the Dutch beam trawl fleet. The majority of Dutch beam trawlers operating in the study area use pulse wing gear and are of the larger size category (approx. 40m in length). From consultation with VisNED it is understood that between 10 and 15 beam trawlers operate in areas relevant to the proposed East Anglia ONE North project, many of which are based in Texel or part of the Lowestoft Producers Organisation (PO). It should be noted that the latter, whilst UK registered, are Dutch owned and operated.
- 46. Fishing using pulse wing trawls is permitted over a wide area of the North Sea, including ICES Division IVc (Southern North Sea) and ICES Division IVb (Central North Sea) to the south of 55°N.
- 47. VMS data (2012 -2016) indicate that Dutch beam trawling occurs at moderate to high levels across wide sections of the Southern North Sea. However, within the offshore development area, activity occurs at comparatively lower levels. The highest levels of activity by this fleet are recorded along the coasts of the Netherlands and Belgium. Some fishing activity also occurs further north, over large areas of the Central North Sea, albeit at relatively low levels (*Figure 13.7* and *Figure 13.8*).
- 48. It should be noted that the northern half of the East Anglia ONE North windfarm site overlaps with one of the three areas where Dutch fishermen have agreed to avoid fishing using pulse wing gear through a voluntary Interim Spatial Separation Agreement with UK East coast fishermen (*Figure 13.9*). Therefore, with the implementation of this voluntary agreement, Dutch vessels using pulse wing trawls would not target grounds across the northern section the East Anglia ONE North windfarm site.

### 13.5.2.3 Dutch Seine Netting

- 49. Fishing activity by Dutch seine netters occurs at considerably lower levels than beam trawling and for the most part concentrates in the English Channel and to a lesser extent in parts of the Central North Sea and the Southern North Sea. Activity by this method in the offshore development area occurs at low levels (*Figure 13.10* and *Figure 13.11*).
- 50. As shown in *Figure 13.5*, landings by this method make a very small contribution to the overall landing values from Dutch vessels in the study area.

### 13.5.2.4 Other Dutch Fishing Methods

51. Fishing activity by other Dutch fishing methods, including pelagic trawlers, demersal otter trawlers, purse seiners, nets, traps and dredgers, occurs at very low/negligible levels within the study area (*Figure 13.12* to *Figure 13.19*).

### 13.5.3 Belgian Fishing Vessels

### 13.5.3.1 Overview

- 52. The principal methods used by the Belgian fleet in the study area are beam trawling and to a lesser extent demersal otter trawling (*Figure 13.20*). It is understood that some vessels are able to operate both gears (*Apendix 13.1 Commercial Fisheries Technical Report*). Belgian vessels in this area target a range of species, primarily sole, but also other flatfish species such as plaice, turbot *Scophthalmus maximus* and brill *Scophthalmus rhombus*, as well as skates and rays (*Figure 13.21*).
- 53. Belgian vessels have historic fishing rights in the study area between the UK's 6 and 12nm limits (*Figure 13.4*).

### 13.5.3.2 Belgian Beam Trawlers

- 54. Belgian beam trawlers have wide operational ranges, targeting grounds in the Southern North Sea, the English Channel, the Celtic Sea and the Irish Sea (*Figure 13.22 and Figure 13.23*).
- 55. During consultation undertaken to inform this chapter (*Table 13.2*), the importance of areas between the UK's 6 and 12nm limit to Beligian vessels was noted by Rederscentrale. In line with this, analysis of VMS data suggests that within the study area, the highest levels of fishing activity are recorded around the central section of the offshore cable corridor (which falls within the 6 -12 nm limit), particularly inmediately to its north and south. Comparatively lower activity levels are however recorded over the offshore cable corridor itself and within the East Anglia ONE North windfarm site.

### 13.5.3.3 Belgian Demersal Otter Trawling

56. Activity by Belgian demersal otter trawlers occurs at lower levels than beam trawling, and takes place over wide areas of the Central and Southern North Sea, the English Channel, the Celtic Sea and the Irish Sea. Fishing activity by these vessels in the offshore development area occurs at very low levels both across the offshore cable corridor and the East Anglia ONE North offshore windfarm site (*Figure 13.24 and Figure 13.25*).

### 13.5.4 United Kingdom Fishing Vessels

### 13.5.4.1 Overview

57. The majority of local UK vessels active in the vicinity of the offshore development area are of under 10m in length. Many of these are multipurpose

having the ability to deploy multiple gears. The principal methods used by these vessels include potting, netting, long lining and trawling to target shellfish species (lobster *Homarus gammarus*, edible crab *Cancer pagurus* and whelk *Buccinum undatum*) as well as fish species such as sole, plaice, rays, cod *Gadus morhua* and bass. By virtue of their small size and associated limited operational range, these vessels primarily operate within the 6nm limit and therefore in areas relevant to of the inshore section of the offshore cable corridor (within rectangle 33F1) *(Figure 13.26, Figure 13.27* and *Diagram 13.1)*.

58. Various vessels are known to target areas further offshore, including areas as far out as the East Anglia ONE North windfarm site. However, in offshore areas within the study area (rectangle 33F2), the majority of landings are from larger vessels (over 15m), mainly beam trawlers targeting flatfish species such as sole and plaice (*Figure 13.26*, *Figure 13.27* and *Diagram 13.2*).

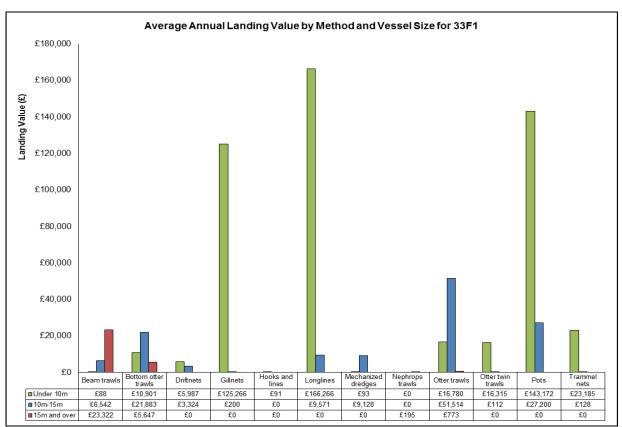

Diagram 13.1 Average UK landings values (2012 to 2016) by method and vessel length in ICES rectangle 33F1 (MMO, 2018)

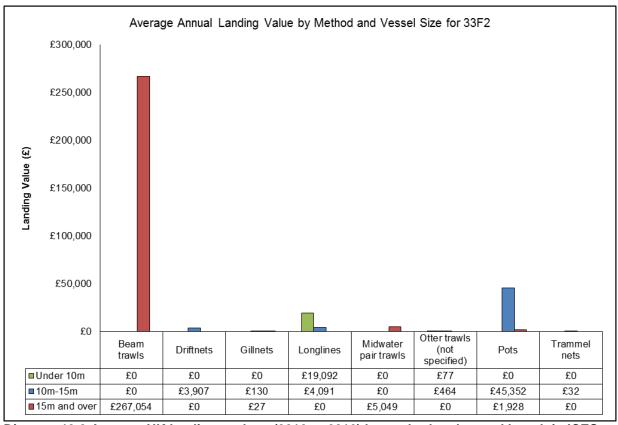

Diagram 13.2 Average UK landings values (2012 to 2016) by method and vessel length in ICES rectangle 33F2 (MMO, 2018)

### 13.5.4.2 Local UK Inshore Fleet

- 59. The extent of the fishing grounds used by local vessels is illustrated in *Figure 13.28 to Figure 13.31*, based on information gathered during consultation.
- 60. Local potting and trawling grounds are located primarily inshore, including in areas relevant to the offshore cable corridor, however some vessels target grounds further offshore in areas to the south of the East Anglia ONE North windfarm site (*Figure 13.28 and Figure 13.29*).
- 61. Longlining grounds are primarily found inshore including in areas relevant to the offshore cable corridor, however some vessels are known to target grounds as far out as the East Anglia ONE North windfarm site (*Figure 13.30*).
- 62. Netting grounds (*Figure 13.31*) extend over a relatively extensive area, including the offshore cable corridor and the East Anglia ONE North windfarm site and the wider area to its north and south.

### 13.5.4.3 Other UK vessels

- 63. In areas relevant to the proposed East Anglia ONE North project, activity by UK vessels other than those part of the local inshore fleets, is primarily by beam trawlers (*Appendix 13.1 Commercial Fisheries Technical Report*). It is understood that the majority of these whilst UK registered are actually Dutch owned and operated (see *Section 13.5.2*). These are referred to as "Anglo-Dutch" beam trawlers.
- 64. In addition to activity by Anglo-Dutch vessels, UK owned and operated beam trawlers from ports in the south west of the UK such as Brixham, Penzance and Newlyn, may also fish occasionally in the study area. However, these vessels for the most part target grounds in the Celtic Sea, Western Approaches and English Channel rather than in areas relevant to the proposed East Anglia ONE North project.
- 65. Analysis of VMS data (*Figure 13.32 and Figure 13.33*) suggests that beam trawling activity by UK registered beam trawlers occurs at relatively low levels across the study area, including areas along the offshore cable corridor and within the East Anglia ONE North windfarm site.

### 13.5.5 French Fishing Vessels

### 13.5.5.1 Overview

- 66. In the study area, French vessels have fishing rights to fish between the UK's 6 and 12nm limit (*Figure 13.4*).
- 67. During consultation with the Comité Régional des Pêches Maritimes et des Elevages Marins (CRPMEM) Hauts de France (*Table 13.2*), it was noted that French fishing activity levels in the offshore development area are relatively low,

with between 1 and 10 vessels operating in the area, mainly in areas relevant to the offshore cable corridor. All vessels coming from the Haut de France area are demersal otter trawlers, a proportion of which also carry pelagic gear to target mackerel. These vessels are primarily based in Boulogne and Etaples and fish in this area in spring for one or two months, targeting mainly whiting *Merlangius merlangus* and squid *Loligo sp*. There are also pelagic freezer trawlers based in Fecamp (Normandie), which target grounds in the area.

- 68. It was also noted during consultation that some vessels steam through the area to target grounds further north.
- 69. In line with the above, analysis of available VMS data for demersal and pelagic French trawlers (*Figure 13.34, Figure 13.35 Figure 13.36* and *Figure 13.37*) suggest that the offshore development area sustains relatively low levels of French fishing, with the majority of activity concentrating in areas south of the proposed East Anglia ONE North project towards the English Channel.

### 13.5.6 Danish Fishing Vessels

### 13.5.6.1 Overview

- 70. In the vicinity of the proposed East Anglia ONE North project, Danish fishing activity is primarily by trawlers, including industrial sandeel trawlers and pelagic trawlers.
- 71. Analysis of VMS data for the sandeel fleet (*Figure 13.38*) suggests that activity by sandeel industrial trawlers is mainly concentrated in areas such as the Dogger Bank (Central North Sea) and the Norwegian coast (Northern North Sea). Although not restricted to these areas activity is considerably lower in the Southern North Sea. In the offshore development area activity by these vessels occurs at negligible levels.
- 72. Similarly, activity by pelagic trawlers also concentrates north of the offshore development area in the Central North Sea, particularly off the coast of Denmark. As for industrial sandeel trawlers, activity by pelagic trawlers in the offshore development area occurs at negligible levels (*Figure 13.39*).

### 13.5.7 German Fishing Vessels

### 13.5.7.1 Overview

- 73. In areas in the vicinity of the East Anglia ONE North project, sightngs of German vessels are primarily of beam trawlers (*Table 13.12*). It is understood, that a number of these, whilst German registered, are Dutch owned and operated (*Appendix 13.1 Commercial Fisheries Technical Report*).
- 74. Analysis of available VMS data for the German fleet (*Figure 13.40*) suggests that activity by these vessels occurs at low levels in the offshore development

area with fishing activity by this fleet for the most part concentrating in the Central North Sea off the German, Danish and Dutch coasts.

### 13.5.8 Climate change and Natural Trends

- 75. Over time, it is anticipated that global climate change will result in changes to the marine environment, including on fish and shellfish populations of commercial importance (Tripathi et al., 2016, Cheung et al., 2012). This may in turn result in modifications to commercial fisheries practices in order to respond to potential changes in species distribution abundance and/or seasonal trends.
- 76. In addition, changes in other factors such as fisheries legislation and regulations (i.e. quota and effort allocation, closed areas, gear restrictions) may also influence the future fisheries baseline. In this context, the potential effects of "Brexit" on the existing fishing baseline should be recognised, including the potential changes to fishing access to non-UK fleets within UK waters.

### **13.6 Potential Impacts**

77. The assessment of the potential impacts on commercial fishing activities as a result of the construction, operation and decommissioning of the proposed East Anglia ONE North project are described in this section. The guidance outlined in **section 13.4.1** provides the basis for impacts taken forward for assessment. The opinions of regulators and stakeholders identified from scoping and direct consultation (see **section 13.2**) have also been considered within the assessment.

### **13.6.1 Potential Impacts during Construction**

## 13.6.1.1 Impact 1: Potential Impacts on Commercially Exploited Fish and Shellfish Species

- 78. There may be potential for the construction of the proposed East Anglia ONE North project to result in impacts on commercially exploited fish and shellfish species. This could in turn indirectly affect the productivity of the fisheries that target them.
- 79. The potential impacts of the proposed East Anglia ONE North project on fish and shellfish species, including those of commercial importance are assessed in *Chapter 10 Fish and Shellfish Ecology* and are not expected to exceed minor adverse significance. Consequently, any impacts associated with this on the commercial fisheries that target them are also not expected to exceed *minor adverse* significance.

## 13.6.1.2 Impact 2: Temporary Loss or Restricted Access to Traditional Fishing Grounds

80. The assessment of temporary loss or restricted access to traditional fishing grounds is discussed below on a fleet by fleet basis. Due to data limitations, it is

beyond the scope of this assessment to assess the impacts on individual vessels. It is however recognised that the level and distribution of fishing activity and dependence on fishing grounds within the offshore development area will vary between individual vessels within the same fleets.

- 81. During construction, restricted access or loss of traditional fishing grounds would be a consequence of the implementation of temporary safety zones around:
  - Construction activities;
  - Partially installed infrastructure; and
  - Vulnerable sections of cables.
- 82. As construction progresses, this would lead to a theoretical worst case under which all fishing activities would be excluded from the entirety of East Anglia ONE North windfarm site and the offshore cable corridor. Offshore construction works, and therefore potential for fishing to be excluded, would last over a period of 27 months, within which export cable installation would occur over two periods of 6 months (**Table 13.4**).
- 83. It should be noted, however, that the total area from which fishing may be excluded may change depending on the level of works being carried out and the level of infrastructure installed or partially installed at a given time. With regards to installation of offshore cables, the actual area and duration of potential exclusion may change depending on the installation method used. For example, simultaneous lay and burial techniques, as used on many previous windfarm projects, could shorten the period of exclusion.

### 13.6.1.2.1 Dutch Fishing Vessels

### Dutch beam trawlers

- 84. The majority of Dutch beam trawlers active in the study area are of the larger class of vessels (i.e. up to 43m in length and main engines of up to 2,000hp). Given their size and engine power these vessels have wide operational ranges and fishing opportunities. In addition, they have the ability to operate in weather conditions which would prevent other fishing vessels from operating. Based on the above, Dutch beam trawlers are considered of low sensitivity to loss of fishing grounds.
- 85. VMS data (2012 -2016) indicate that Dutch beam trawling activity occurs at moderate to high levels across wide sections of the Southern North Sea with the highest levels of activity recorded along the coasts of the Netherlands and Belgium (*Figure 13.7 and Figure 13.8*).

- 86. However, within the offshore development area, beam trawling by Dutch vessels takes place at comparatively low levels. In addition, the offshore cable corridor and the East Anglia ONE North windfarm site represent a small area in the context of the extent of grounds available to these vessels.
- 87. With this in mind and taking account of the temporary nature of the construction phase, the magnitude of the effect is considered to be low.
- 88. Taking the low receptor sensitivity and the low magnitude of effect, the significance of the impact of temporary loss or restricted access to fishing grounds during construction is considered to be **minor adverse**.
- 89. It should be noted that where the voluntary Interim Separation Agreement is in place during the construction phase of the proposed East Anglia ONE North project, under normal circumstances, Dutch beam trawlers operating pulse wing gear would not be active in the northern half of the East Anglia ONE North windfarm site as this falls within one of the areas that Dutch fishermen have agreed to avoid (*Figure 13.9*).

### Dutch seine netters

- 90. Dutch seine netters have wide operational ranges with their fishing opportunities extending over a large area, from the north of Denmark, south to the English Channel towards the Western Approaches. Taking account of their operational range and availability of grounds, they are considered receptors of low sensitivity.
- 91. Fishing activity by Dutch seine netters in the Southern and Central North Sea occurs at considerably lower levels than beam trawling. The highest levels of activity concentrate south of the offshore development area, around the English Channel.
- 92. Activity by this method in the offshore development area occurs at low levels (**Figure 13.10 and Figure 13.11**). In addition, the offshore cable corridor and the East Anglia ONE North windfarm site represent a small area in the context of the extent of grounds available to these vessels. With this in mind and taking account of the temporary nature of the construction phase, the magnitude of the effect is considered to be low.
- 93. This combined with the low sensitivity of the receptor, results in an impact of **minor adverse** significance.

### Other Dutch fishing methods

94. Other fishing methods deployed by Dutch vessels include pelagic trawls, demersal otter trawls, purse seines, nets, traps and dredges. Vessels operating

pelagic trawls and demersal otter trawls have wide operational ranges whilst those operating purse seines, nets, traps and dredges have a more restricted operational range. In view of the more limited areas that purse seines, nets, traps and dredges may be able to exploit they are considered of medium sensitivity to loss of fishing grounds, whilst vessels deploying pelagic trawls and demersal otter trawls are considered to be of low sensitivity.

- 95. It should be noted that fishing within the offshore development area occurs at very low / negligible levels by all these methods (*Figure 13.10* and *Figure 13.11*). Taking this into account together with the temporary nature of the construction phase the magnitude of the effect is considered to be negligible.
- 96. This, in combination with the sensitivity of the receptors identified above results in an impact of **negligible** significance.

### 13.6.1.2.2 Belgian Fishing Vessels

### Belgian beam trawlers

- 97. The fishing grounds of Belgian beam trawlers cover substantial areas of the Southern North Sea, English Channel, Celtic Sean and parts of the Central North Sea and the Irish Sea. Given their wide operational range and fishing opportunities their sensitivity to loss of fishing grounds is considered to be low.
- 98. Within the study area, the highest levels of fishing activity are recorded immediately to the north and south of the offshore cable corridor However, in both the East Anglia ONE North windfarm site and along the offshore cable corridor, activity by these vessels is comparatively low (*Figure 13.22 and Figure 13.23*). Considering this, together with the small proportion of the overall grounds available to these vessels that the offshore development area represents and the temporary and short nature of construction activities, the magnitude of the effect is assessed as low.
- 99. Taking the low sensitivity of the receptor and low magnitude of the effect, the impact of temporary loss or restricted access to fishing grounds for the Belgian beam trawl fleet is assessed to be of **minor adverse** significance.

### Demersal trawlers

- 100. The operational range and associated fishing opportunities of the Belgian demersal otter trawl fleet is similar to that described above for beam trawlers. On this basis they are also considered of low sensitivity to temporary loss of restricted access to fishing grounds.
- 101. Analysis of VMS data for demersal otter trawlers (*Figure 13.23 and Figure 13.24*)) indicates that activity by these vessels in the offshore development area occurs at very low levels, with activity for the majority concentrating south of the proposed East Anglia ONE North project and in discrete areas of the Central

North Sea. Considering the large operational range of vessels, the relatively small area occupied by the offshore development area and the temporary nature of the construction phase, the magnitude of the effect is assessed as negligible.

102. Taking the low sensitivity of the receptors and the negligible magnitude of effect the impact of loss or restricted access to fishing grounds for the Belgian demersal otter trawl fleet during construction is considered to be of **negligible** significance.

### 13.6.1.2.3 United Kingdom Fishing Vessels

Local inshore vessels

- 103. The majority of local UK vessels active in the vicinity of the offshore development area are less than 10m. Whilst a number of the vessels have multipurpose capabilities, being able to deploy pots, trawls nets and/or lines, given their small size and associated limited operational ranges, their sensitivity to loss of fishing grounds is considered to be medium.
- 104. The available data and information obtained during consultation in respect of the location of fishing grounds of local UK vessels suggest that the majority of activity in areas relevant to the offshore development area occurs across the offshore cable corridor (*Figure 13.28 to Figure 13.31*). Potential loss of fishing grounds to the UK local inshore fleet during construction would therefore for the most part be a result of export cable installation activities. It is however recognised that some vessels, particularly longliners and netters, may also target grounds within the East Anglia ONE North windfarm site and therefore may also be affected by construction works undertaken in the windfarm site.
- 105. Considering the short term and temporary nature of construction activities and the relatively small extent of the offshore development area in the context of the grounds available to this fleet overall, the magnitude of the impact is assessed to be low. It is however recognised, that depending on their degree of dependence on grounds in the offshore development area, for some individual vessels the magnitude of the impact may be proven to be medium.
- 106. In general terms, taking the medium sensitivity of the local fleets and the low magnitude of the effect for the overall fleet, the impact significance is considered **minor adverse**.
- 107. In respect of the potential impact on individual vessels for which the magnitude of the effect may be medium, the significance of the impact is moderate adverse and therefore significant in EIA terms. It should be noted, however, that in instances when fishing gear may need to be temporarily relocated due to construction activities, appropriate evidence-based mitigation, as specified in

the FLOWW Guidelines will be applied. With the implementation of the above, the residual impact on these vessels would be reduced to **minor adverse**.

### Other UK Vessels

- 108. With regards to UK vessels other than those that form part of the local inshore fleet, as mentioned in **section 13.5.2**, in areas relevant to the proposed East Anglia ONE North project, activity is primarily by beam trawlers. It is understood that the majority of these, whilst UK registered, are Dutch owned and operated (Anglo Dutch). As such, these vessels are effectively Dutch beam trawlers and therefore are assigned the same sensitivity as described above for the Dutch beam trawl fleet (**Section 13.6.1.2.1**), namely low.
- 109. In the case of UK owned beam trawlers operating from south-west ports, these predominantly target grounds in the Celtic Sea, Western Approaches and English Channel. In view of their wide operational range and associated fishing opportunities, they are also considered of low sensitivity to loss or restricted access to fishing grounds.
- 110. Analysis of VMS data (*Figure 13.32 and Figure 13.33*) suggests that beam trawling activity by UK registered beam trawlers occurs at relatively low levels across the study area, with low levels of activity recorded along the offshore cable corridor and the East Anglia ONE North windfarm site. Considering this together with the small proportion of the overall grounds available to these vessels that the offshore development area represents and the temporary nature of the construction phase, the magnitude of the effect is assessed as low. This is considered to be the case in respect of Anglo-Dutch vessels.
- 111. In the particular case of UK owned and operated beam trawlers for south-west ports, it is understood that only a limited number of these vessels may occasionally target sole off the coast of East Anglia on a seasonal basis. Considering the comparatively low levels of activity by these vessels in areas relevant to the project, the magnitude of the effect is assessed as negligible.
- 112. Taking the above into account the impact of temporary loss or restricted access to fishing grounds during construction is considered to be of minor adverse significance in the case of Anglo-Dutch beam trawlers and of negligible significance in the case of UK beam trawlers from south-west ports.

### 13.6.1.2.4 French Fishing Vessels

113. French demersal and pelagic trawlers target a variety of species and have wide operational ranges, exploiting grounds from the Central North Sea to the English Channel and on occasions to the Western approaches. Taking account of their wide operational range and fishing opportunities they are considered of low sensitivity to temporary loss or restricted access to fishing grounds.

- 114. From consultation and the data that has been made available (*Appendix 13.1 Commercial Fisheries Technical Report*) it is apparent that French fishing activity levels in the offshore development area are relatively low, with the majority of activity concentrating in areas south of the proposed East Anglia ONE North project towards the English Channel (*Figure 13.34*, *Figure 13.35*, *Figure 13.36* and *Figure 13.37*).
- 115. Considering this, together with the small proportion of the overall grounds available to French vessels that the offshore development area represents and the temporary nature of the construction phase, the magnitude of the effect is assessed as low.
- 116. Taking the above into account the impact of temporary loss or restricted access to fishing grounds during construction is considered to be of **minor adverse** significance.

### 13.6.1.2.5 Danish Fishing Vessels

- 117. Danish sandeel and pelagic trawlers have wide operational ranges and fishing opportunities being active over wide areas of the Central North Sea and therefore their sensitivity to loss of fishing grounds is considered to be low.
- 118. Analysis of VMS data for the sandeel and pelagic fisheries (*Figure 13.38 and Figure 13.39*) indicates that fishing activity by these vessels occurs at negligible levels in the offshore development area.
- 119. Considering this and the temporary nature of the construction phase, the magnitude of the effect is assessed as negligible.
- 120. This, combined with the low sensitivity of both fleets results in an impact of **negligible** significance.

### 13.6.1.2.6 German Fishing Vessels

- 121. It is understood that German fishing activity in the vicinity of the offshore development area is mainly by beam trawlers. Some of these are German registered fishing German quotas but Dutch owned and operated. These vessels have wide operational ranges and therefore, as previously described for other beam trawl fleets, they are considered of low sensitivity to loss of fishing grounds.
- 122. Analysis of available VMS data for German vessels (*Figure 13.40*) suggests low levels of fishing activity in areas relevant to the offshore development area, with activity concentrating for the most part in the Dutch and Danish Sector of the Central North Sea. Considering this together with the temporary nature of the construction phase, the magnitude of the effect is assessed as low.

123. Taking the low sensitivity of the receptor and low magnitude of the effect, the impact of temporary loss or restricted access to fishing grounds during construction is considered to be of **minor adverse** significance.

### 13.6.1.3 Impact 3: Displacement of Fishing Activity into other Areas

- 124. There is the potential for temporary loss of access to fishing grounds during construction to lead to a temporary relocation of fishing activity which in turn could result in increased competition for fishing grounds in other areas.
- 125. It is possible that static gears operated by local inshore vessels could be displaced during the construction phase whereby gears are required to be relocated, particularly during installation of export cables. This, in turn could result in competition for grounds elsewhere between local inshore vessels. However, considering the number of static gear that a relatively small area such as the cable corridor can viably support, the number of static gear units capable of causing a displacement effect would be limited. Furthermore, as stated above in respect of loss of fishing area, in instances where static gear needs to be relocated appropriate procedures as specified in FLOWW Guidelines would be implemented.
- 126. There may also be potential for larger trawlers to be displaced into areas where static gears are deployed. As described in **Section 13.5.4**, the majority of the static gear vessels operate within the 12nm limit (and mostly within the 6nm limit). Activity in areas relevant to the project beyond the 12nm is predominantly by Dutch and Anglo Dutch beam trawlers. By virtue of their main engine power and gear sizes these vessels are not permitted to fish within the UK's 12nm. In the case of Belgian and French vessels, the larger class of these vessels are also prohibited from fishing within the UK's 12nm limit. However, it is acknowledged that the small class with engines of less than 300hp can fish between the 6 and 12nm limits due to historic fishing rights. Activity by the remaining towed gear fleets in the offshore development area is relatively low and occurs beyond the 12nm limit (i.e. Danish, German vessels).
- 127. From the information provided above, it is apparent that there is little potential for competition for fishing grounds to occur between local inshore vessels. Similarly, it is apparent that there is little potential for conflicts between local inshore and larger towed gear vessels to occur. Therefore the magnitude of the effect of displacement on the local inshore fishing fleet is considered to be low. In view of the limited operational range of local inshore vessels, as for the assessment of temporary loss or restricted access to fishing grounds, their sensitivity to displacement is considered to be medium.

- 128. Taking into account the medium sensitivity of the local inshore fleet and the negligible magnitude of the effect, the impact of displacement is assessed to be of **minor adverse** significance.
- 129. In addition to the above, it is recognised that there could be potential for displacement of fishing vessels into other areas to result in competition for grounds between different fleets that operate towed gear.
- 130. For the most part these fleets have wide operational ranges relative to the potential loss of grounds associated with the construction phase. Therefore, any increased competition between these vessels arising from displacement would be expected to be minimal. Whilst it is difficult to predict where fishing activity may be displaced to and how this may affect individual vessels, in all cases, the level of displacement would be a function of the temporary loss or restricted access to fishing grounds. It is therefore considered that the sensitivity of receptors, magnitude of effect and resulting impact significance in respect of displacement would, at worst, be as identified in relation to temporary loss or restricted access to fishing grounds for towed gear fleets. As shown in *Table* 13.13 below this would result in an impact of negligible to minor adverse significance depending on the towed gear fleet under consideration.

Table 13.13 Impact significance of displacement of fishing activity into other areas for towed gear fleets

| Receptor Group  |                                       | Receptor<br>sensitivity | Magnitude of<br>Effect | Impact<br>Significance |
|---|---------------------------------------|-------------------------|------------------------|------------------------|
| Dutch Beam Trawlers                                     |                                       | Low                     | Low                    | Minor adverse          |
| Dutch Seine Netters                                     |                                       | Low                     | Low                    | Minor adverse          |
| Other Dutch<br>Methods                                  | Demersal , pelagic (otter) trawls     | Low                     | Negligible             | Negligible             |
|   | Nets, purse seines, traps and dredges | Medium                  | Negligible             | Negligible             |
| Belgian Beam Trawlers                                   |                                       | Low                     | Low                    | Minor adverse          |
| Belgian Demersal Otter Trawlers                         |                                       | Low                     | Negligible             | Negligible             |
| UK Beam Trawlers (Anglo-Dutch)                          |                                       | Low                     | Low                    | Minor adverse          |
| UK Beam Trawlers (south-west ports)                     |                                       | Low                     | Negligible             | Negligible             |
| French demersal and pelagic trawlers                    |                                       | Low                     | Low                    | Minor adverse          |
| Danish sandeel industrial trawlers and pelagic trawlers |                                       | Low                     | Negligible             | Negligible             |

| Receptor Group         | Receptor    | Magnitude of | Impact        |
|------------------------|-------------|--------------|---------------|
|                        | sensitivity | Effect       | Significance  |
| German fishing vessels | Low         | Low          | Minor adverse |

### 13.6.1.4 Impact 4: Increased Steaming Times to Fishing Grounds

- 131. During construction, the implementation of safety zones could result in increased steaming distances and times and therefore increased operational costs for some fishing vessels.
- 132. The majority of steaming routes of towed gear vessels from the Netherlands, Belgium, UK, France and other nations between primary fishing grounds and home ports do not go through the offshore development area. Therefore, there would be little potential for changes to steaming routes caused by temporary safety zones associated with the construction of the proposed East Anglia ONE North project. Therefore, the sensitivity of these receptors is considered to be negligible.
- 133. In the case of local inshore vessels, fishing activity for the most part does not extend to areas offshore of the East Anglia ONE North windfarm site and mainly concentrates in areas along the offshore cable corridor. In general terms, it is therefore expected that there would be few occasions when there would be a requirement to change existing steaming routes to avoid safety zones. It is recognised however that in the case of inshore vessels operating from ports in the immediate vicinity of the landfall site, the degree of potential interaction with safety zones may be higher. Therefore, the sensitivity of this fleet is considered to be low.
- 134. Given the relatively small footprint of the safety zones that may be applied during construction and their short term and temporary nature, the magnitude of the effect is considered to be low (for both the local inshore fleet and the rest of the fleets).
- 135. Considering the sensitivities identified above (low for the local inshore fleet and negligible for the remaining fleets) and the low magnitude of the effect, the impact of increased steaming times to fishing grounds is considered to be of **minor adverse** significance for the local inshore fleet and of **negligible** significance for the rest of the fleets.

### 13.6.1.5 Impact 5: Interference with Fishing Activities

136. During construction, there may be potential for the transit of construction vessels to result in interference with fishing activities in the study area.

- 137. In relation to the local UK inshore vessels operating static gear, interference with fishing activity would mainly result from fouling of static gear markers by construction vessels such as crew transfer vessels which would be transiting through the offshore development area. The majority of gear markers used by fishermen operating gear within 12nm of the coast are unlit, without radar reflectors and often simple markers such as plastic bottles or footballs. Thus, these markers are not visible in all conditions. With this in mind and taking account of the non-mobile nature of the gear used by the local static gear fleet the sensitivity to interference of UK vessels operating static gear is considered medium.
- 138. As described in **section 13.3.3**, appropriate fisheries liaison will be undertaken with relevant fishing interests to ensure they are fully informed of construction activities. This will include provisions for enabling awareness of construction vessels crews of the locations of static gears and fishermen's awareness of construction vessel transit routes. In addition, a Marine Coordinator will provide up to date information to onshore Fisheries Liaison Officers that can be relayed to local fishermen. With the implementation of the above, the magnitude of the effect for the local static gear fleet is considered low, and the impact significance is assessed as **minor adverse**.
- 139. In the case of fleets operating towed gears, taking account of their mobility, the sensitivity to interference is considered to be low. Transiting construction vessels will fully comply as required under the International Regulations for Preventing Collisions at Sea (COLREGS). Such compliance would negate the requirement for fishing vessels engaged in fishing to alter course or pose any risk to fishing gears being towed. With the above in mind the magnitude of the impact in respect of fleets operating towed gear is considered to be negligible, resulting in an impact of negligible significance.

### 13.6.1.6 Impact 6: Safety Issues for Fishing Vessels

- 140. With regards to safety issues for fishing vessels, as outlined in section 13.4.3.4, the use of the standard impact assessment matrix is not considered appropriate. Safety risks are therefore discussed in terms of being within or outside of acceptable limits in line with the approach adopted in **Chapter 14 Shipping and Navigation**.
- 141. The potential risk of fishing gear snagging and the manoeuvrability of vessels is assessed below.
- 142. The progressive installation of wind turbine foundations during the construction phase would result in increasing potential for manoeuvrability risks to fishing vessels. In addition snagging risks may arise as a result of sections of cables remaining exposed on the seabed whilst awaiting burial or protection measures.

- 143. Safety zones will be in place around construction works and partially installed and installed infrastructure. In addition, in areas where cables are awaiting burial or protection, localised advisory safety zones would be implemented to prevent fishing gear snagging and the subsequent risks to both the cables and fishing vessels and their gears.
- 144. Furthermore, potential risks to fishing vessels would be minimised by implementation of the required levels of communication through the specific channels of the Kingfisher Information System, Notices to Mariners, as well as direct liaison with fishermen and their representatives. This would ensure the required level of awareness of potential construction related risks and the locations and periods of safety exclusion zones amongst fishing vessel owners and crews. In addition, guard vessels and Offshore Fishing Liaison Officers (OFLOs) would be employed, where necessary, to further aid liaison.
- 145. In conclusion, with the application of the liaison and information distribution discussed above and the required compliance by fishermen, safety issues for fishing vessels should remain **broadly acceptable**.
- 146. A separate assessment of potential safety issues associated with seabed obstacles is provided in **Section 13.6.1.7.** Safety risks associated with potential for collisions with construction vessels and allision with project infrastructure are addressed in **Chapter 14 Shipping and Navigation**.

### 13.6.1.7 Impact 7: Seabed Obstacles

- 147. Obstacles on the seabed during construction could potentially cause damage to, or complete loss of fishing gears. In addition, activities associated with construction works such as construction vessel anchoring, jack up legs or cable trenching could produce spoil or mounds onto which fishing gears could fasten.
- 148. It should be noted, that offshore policy (IMO, 1996) prohibits the discarding of objects or waste at sea. The reporting and recovery of any accidentally dropped object is also required.
- 149. A cable burial risk assessment will be undertaken post consent, in consultation with the MMO and their advisors.
- 150. In order to assess the sea bed status, post-lay and burial inspection surveys may be undertaken after installation of cables, as discussed in **section 13.3.3.**
- 151. With the above procedures in place, safety issues to fishing vessels associated with obstacles on the sea bed would be **broadly acceptable**.

### 13.6.2 Potential Impacts during Operation

- 152. The impacts described below should be considered in the context of the design life of the proposed East Anglia ONE North project..
- 153. The same receptor sensitivities identified for the construction phase apply for assessment of impacts during operation. Therefore, where relevant, reference is made to relevant sections within the impact assessment presented for the construction phase (**Section 13.6.1**).

## 13.6.2.1 Impact 1: Potential Impacts on Commercially Exploited Fish and Shellfish Populations

- 154. There may be potential for the operational phase of the proposed East Anglia ONE North project to result in impacts on commercially exploited fish and shellfish species. This could in turn indirectly affect the productivity of the fisheries that target them.
- 155. The potential impacts of the proposed East Anglia ONE North project on fish and shellfish species, including those of commercial importance are assessed in *Chapter 10 Fish and Shellfish Ecology* and are not expected to exceed minor adverse significance. Consequently, any impacts associated with this on the commercial fisheries that target them are also not expected to exceed *minor adverse* significance.

### 13.6.2.2 Impact 2: Complete Loss or Restricted Access to Traditional Fishing Grounds

- 156. Existing UK legislation does not prevent fishing from occurring in operational windfarm sites. It is therefore expected that for the most part, fishing would be able to resume within the East Anglia ONE North windfarm site during the operational phase.
- 157. As described in *Table 13.4*, the worst case assumption in respect of loss of fishing grounds during operation takes account of the installation of 67 wind turbines (12MW) with a minimum inter-row spacing of 1,200m and a minimum in-row spacing of 800m.
- 158. In view of the worst case parameters noted above, it anticipated that the majority of vessels deploying towed and static gear would be able to operate within the East Anglia ONE North windfarm site. It is however recognised that some methods such as longlining or netting may need to adapt their operating practices to resume fishing in the operational site and that in the case of seine netting, fishing may not be possible.
- 159. Offshore cables (inter-array, platform link and export cables) will be buried where possible to at least 0.5m. Where burial is not possible (i.e. due to hard ground or at cable crossings) cables would be protected. In line with standard practice in the North Sea oil and gas industry, measures would be undertaken

to ensure that where cable protection is required, the protection methods used are compatible with fishing activities where practically possible. Therefore, it is assumed that during the operational phase, the presence of offshore cables would for the most part not result in a material loss of fishing grounds as normal fishing activity would occur in areas where cables are installed except in instances when temporary maintenance works are required.

160. As such, the focus of the assessment of loss or restricted access to fishing grounds presented below is focused on impacts associated with the presence of infrastructure other than cables (i.e. wind turbines, offshore electrical and construction, operation and maintenance platforms) all of which are to be located within the East Anglia ONE North windfarm site.

### 13.6.2.2.1 Dutch Fishing Vessels

### Beam trawlers

- 161. As previously mentioned, Dutch beam trawling activity occurs at moderate to high levels across a wide section of the Southern North Sea, However, the highest levels of activity are recorded along the coasts of the Netherlands and Belgium and activity within the East Anglia ONE North windfarm site is comparatively low.
- 162. Loss or restricted access to fishing grounds during operation would be long term, however, Dutch beam trawlers would be able regain access for fishing to most of the East Anglia ONE North windfarm site. Therefore the magnitude of the effect is considered to be low.
- 163. As discussed before for the construction phase (Section 13.6.1.2.1) the sensitivity of Dutch beam trawlers to loss of fishing grounds is considered to be low. This combined with the low magnitude of the effect described above results in an impact of minor adverse significance.
- 164. In the context of this assessment it is important to note that where the voluntary Interim Separation Agreement between Dutch beam trawlers and UK fishermen is in place during the operation phase of the proposed East Anglia ONE North project, under normal circumstances, Dutch beam trawlers operating pulse wing gear would not be active in the northern half of the East Anglia ONE North windfarm site (*Figure 13.9*).

### Seine netting

165. As previously mentioned, seine netters may not be able to deploy their gear within the operational East Anglia ONE North windfarm site. However, fishing activity by Dutch seine netters in the East Anglia ONE North windfarm site occurs at low levels, with the majority of activity concentrating to the south towards the English Channel (Figure 13.10 and Figure 13.11). In addition, the area that the East Anglia ONE North windfarm site represents is small in the

- context of the extent of grounds available to these vessels. Whilst the long term nature of the operational phase is recognised, taking account of the above, the magnitude of the effect is considered to be low.
- 166. As discussed for the construction phase (**Section 13.6.1.2.1**), the sensitivity of Dutch seine netters to loss of fishing grounds is low. This, in combination with the low magnitude of the effect results in an impact of **minor adverse** significance.

### Other Dutch fishing methods

- 167. Fishing within the East Anglia ONE North windfarm site by Dutch fishing vessels, other than beam trawlers and seine netters (pelagic trawlers, demersal otter trawlers, purse seines, nets, traps and dredges) occurs at very low/negligible levels (*Figure 13.10 and Figure 13.11*). Considering the limited levels of activity of these vessels in the site, the magnitude of the effect is assessed as negligible.
- 168. As discussed for the construction phase (**Section 13.6.1.2.1**), the sensitivity of pelagic trawlers and demersal otter trawlers to loss of fishing grounds is considered to be low, whilst for purse seines, nets, traps and dredges the sensitivity is considered medium. This, in combination with the negligible magnitude of the effect results in an impact of **negligible significance**.

### 13.6.2.2.2 Belgian Fishing Vessels

### Beam trawling

- 169. Belgian beam trawlers record relatively low levels of activity in the East Anglia ONE North windfarm site, with comparatively higher levels concentrating in areas around the central section of the offshore cable corridor (where fishing during the operational phase would remain largely unaffected).
- 170. Loss or restricted access to fishing grounds during operation would be long term, however, Belgian beam trawlers would be able regain access for fishing to most of the East Anglia ONE North windfarm site. Therefore the magnitude of the effect is considered to be low.
- 171. As discussed before for the construction phase (**Section 13.6.1.2.2**) the sensitivity of Belgian beam trawlers to loss of fishing grounds is considered to be low. This combined with the low magnitude of the effect described above results in an impact of **minor adverse** significance.

### Demersal (otter) trawling

172. Activity by Belgian demersal otter trawlers occurs at very low levels in the East Anglia ONE North offshore windfarm site (*Figure 13.23, Figure 13.24, Figure 13.25 and Figure 13.26*).

- 173. Whilst the long term duration of the operational phase is recognised, considering the limited level of activity of these vessels in the site and the fact that they would be able regain access for fishing to most of the East Anglia ONE North windfarm site, the magnitude of the effect is assessed as negligible.
- 174. As discussed for the construction phase (**Section 13.6.1.2.2**), the sensitivity of demersal trawlers to loss of fishing grounds is considered to be low. This, in combination with the negligible magnitude of the effect results in an impact of **negligible significance.**

### 13.6.2.2.3 United Kingdom Fishing Vessels

Local inshore vessels

- 175. The available data and the information obtained during consultation in respect of the location of fishing grounds of local inshore UK vessels, suggest that the majority of activity in areas relevant to the offshore development area occurs across the offshore cable corridor (*Figure 13.27 to Figure 13.30*). The local inshore fleet would be able to resume fishing activity along the export cables during the operational phase as prior to their installation and therefore in general terms the magnitude of the impact on local inshore fishing vessels is considered to be negligible.
- 176. It is recognised, however, that a portion of the longlining and netting fleet in addition to targeting areas relevant to the offshore cable corridor may also target grounds further offshore, including the area where the East Anglia ONE North windfarm site is located. It is anticipated that for the most part, these vessels would be able to resume fishing within the operational site, although it is recognised that some changes to their mode of operation may be required. Furthermore, the area of the East Anglia ONE North windfarm site that these vessels target represents a relatively small proportion of their overall grounds (Figure 13.29 and Figure 13.30). Whilst the long term nature of the operational phase is recognised, considering the above, the magnitude of the effect on longliners and netters is assessed to be low.
- 177. As discussed before for the construction phase (**Section 13.6.1.2.3**) the sensitivity of local inshore UK vessels to loss of grounds is considered to be medium. This, in combination with the magnitude of effect identified above would result in an impact of **negligible** significance for the local inshore fleet in general and of **minor adverse** significance for those vessels (particularly longliners and netters) that may be active in areas relevant to the East Anglia ONE North offshore windfarm site.

### Other UK vessels

178. Analysis of VMS data (*Figure 13.31 and Figure 13.32*) suggests that beam trawling activity by UK registered beam trawlers occurs at relatively low levels

across the study area, with relatively low levels of activity recorded within the East Anglia ONE North windfarm site. In addition, UK registered beam trawlers would be able regain access for fishing to most of the East Anglia ONE North windfarm site. Whilst the long term nature of the operational phase is recognised, considering the above, the magnitude of the effect is assessed to be low. This is considered to be the case in respect of Anglo-Dutch beam trawlers.

- 179. In the particular case of UK owned and operated beam trawlers from southwest ports, it is understood that only a limited number of these vessels may occasionally target sole off the coast of East Anglia on a seasonal basis. Considering the comparatively low levels of activity by these vessels in areas relevant to the East Anglia ONE North windfarm site, the magnitude of the effect is assessed as negligible.
- 180. As discussed before for the construction phase (**Section 13.6.1.2.3**) the sensitivity of UK registered beam trawlers (both Anglo Dutch and south-west ports vessels) to loss of fishing grounds is low.
- 181. The impact of temporary loss or restricted access to fishing grounds during operation is therefore considered to be of **minor adverse** significance in the case of Anglo-Dutch beam trawlers and of **negligible** significance in the case of UK owned and operated beam trawlers.

### 13.6.2.2.4 French Fishing Vessels

- 182. As previously mentioned (**Section 13.5.5**), fishing activity levels by French demersal and pelagic trawlers in the East Anglia ONE North windfarm site is low with the majority of activity concentrating in areas to the south towards the English Channel (**Figure 13.33**, **Figure 13.35**, **Figure 13.36** and **Figure 13.36**).
- 183. Loss or restricted access to fishing grounds during operation would be long term, however, French demersal and pelagic trawlers would be able regain access for fishing to most of the East Anglia ONE North windfarm site. Therefore the magnitude of the effect is considered to be low.
- 184. As discussed before for the construction phase (**Section 13.6.1.2.4**) the sensitivity of French demersal and pelagic trawlers to loss of fishing grounds is low. This, combined with the low magnitude of the effect identified above results in an impact of **minor adverse** significance.

### 13.6.2.2.5 Danish Fishing Vessels

185. Activity by sandeel and pelagic Danish trawlers occurs at negligible levels within the East Anglia ONE North windfarm site (*Figure 13.37 and Figure 13.38*). Whilst the long term nature of the operational phase is recognised, in view of the above, the magnitude of the effect is considered to be negligible.

186. As discussed before for the construction phase (**Section 13.6.1.2.5**) the sensitivity of sandeel and pelagic Dutch trawlers to loss of fishing grounds is low. This, combined with the negligible magnitude of the effect identified above results in an impact of **negligible** significance

### 13.6.2.2.6 German Fishing Vessels

- 187. Analysis of available VMS data for German vessels (*Figure 13.39*) suggests low levels of fishing activity occur in areas relevant to the East Anglia ONE North offshore windfarm site, with activity concentrating for the most part in the Dutch and Danish Sector of the Central North Sea.
- 188. Loss or restricted access to fishing grounds during operation would be long term, however, German vessels would be able regain access for fishing to most of the East Anglia ONE North windfarm site. Therefore the magnitude of the effect is considered to be low.
- 189. As discussed before for the construction phase (**Section 13.6.1.2.6**) the sensitivity of German beam trawlers to loss of fishing grounds is low. This, combined with the low magnitude of the effect identified above results in an impact of **minor adverse** significance.

### 13.6.2.3 Impact 3: Displacement of Fishing Activity into Other Areas

- 190. The majority of activity by local UK inshore vessels around the offshore development area occurs within the 12nm limit, and therefore in areas relevant to the offshore cable corridor. As export cables would be buried, with the exception of some vessels that operate in areas further offshore including in areas relevant to the East Anglia ONE North windfarm site (particularly long liners and netters), for the most part fishing by local inshore vessels would be able to continue as it occurred prior to cable installation. The potential for conflicts between these vessels associated with displacement would therefore be limited. Similarly, the potential for conflicts between local inshore vessels and larger towed gear vessels would be limited as the latter would be able to regain access to most of the East Anglia ONE North windfarm site and would be able to fish along the offshore cable corridor. With this in mind the magnitude of the effect is considered to be low.
- 191. As discussed for the construction phase (**Section 13.6.1.3**) the sensitivity of the local inshore fleet to displacement is considered to be medium. Taking this and the low magnitude of the effect identified above, the significance of the impact is considered to be **minor adverse**.
- 192. In respect of vessels operating towed gear, as outlined for the construction phase (**Section 13.6.1.3**), it is considered that the sensitivity of the receptors, magnitude of the effect and resulting impact significance would, at worst, be as

identified in relation to complete loss or restricted access to fishing grounds (**Section 13.6.2.2**). As summarised in **Table 13.14**, this would result in an impact of negligible to minor adverse significance, depending on the fleet under consideration.

Table 13.14 Impact significance of displacement of fishing activity into other areas for vessels

operating towed gears

| Receptor Group  |   | Receptor    | Magnitude of | Impact        |
|---|---|-------------|--------------|---------------|
|   |   | sensitivity | Effect       | Significance  |
| Dutch Beam Trawling                                     |   | Low         | Low          | Minor adverse |
| Dutch Seine Netting                                     |   | Low         | Low          | Minor adverse |
| Other Dutch<br>Methods                                  | Demersal (otter) trawls, pelagic trawls | Low         | Negligible   | Negligible    |
|   | Nets, purse seines, traps and dredges   | Medium      | Negligible   | Negligible    |
| Belgian Beam Trawling                                   |   | Low         | Low          | Minor adverse |
| Belgian Demersal Otter Trawling                         |   | Low         | Negligible   | Negligible    |
| UK Beam Trawling (Anglo-Dutch)                          |   | Low         | Medium       | Minor adverse |
| UK Beam Trawling (Southwest ports)                      |   | Low         | Negligible   | Negligible    |
| French demersal and pelagic trawlers                    |   | Low         | Low          | Minor adverse |
| Danish sandeel industrial trawling and pelagic trawlers |   | Low         | Negligible   | Negligible    |
| German fishing vessels                                  |   | Low         | Low          | Minor Adverse |

### 13.6.2.4 Impact 4: Increased Steaming Times to Fishing Grounds

- 193. During operation, the presence of installed infrastructure could potentially result in increases in steaming times for some fishing vessels, in turn causing higher operational costs.
- 194. As described in *Chapter 14 Shipping and Navigation*, it is anticipated that during the operational phase, fishing vessels will be able to steam through the operational East Anglia ONE North windfarm site. Therefore, the magnitude of the effect is considered to be negligible.
- 195. As discussed for the construction phase (**Section 13.6.1.4**), for local inshore vessels, the sensitivity to increased steaming times is considered to be low and for the remaining fleets is considered to be negligible. This, in combination with

the negligible magnitude of the effect identified above results in an impact of **negligible** significance for both the local inshore fleet and the remainder fleets.

### 13.6.2.5 Impact 5: Interference with Fishing Activities

- 196. During the operational phase there may be potential for transiting operation and maintenance vessels to result in interference with fishing activities through navigational conflict.
- 197. As discussed for the construction phase (**Section 13.6.1.5**), the sensitivity to interference is considered to be medium for local vessels operating static gear and low for towed gear vessels.
- 198. The appropriate two-way liaison with local fishermen described for the construction phase would continue during the operational phase to minimise risks of interference with static gears.
- 199. In the case of towed gear vessels, the same obligations in respect of COLREGS as specified for the construction phase (**Section 13.6.1.5**) will apply to operation and maintenance vessels.
- 200. Considering the above the magnitude of the effect is assessed to be low in respect of static gear vessels and negligible in respect of both vessels operating towed gear. This combined with the sensitivity of the receptors results in an impact of minor adverse significance for static gear vessels and of negligible significance in the case of towed gear vessels

### 13.6.2.6 Impact 6: Safety Issues for Fishing Vessels

- 201. During operation, the presence of infrastructure would result in increased potential for snagging and manoeuvrability risks for fishing vessels. In addition snagging risks may arise as a result of sections of inter-array, platform link and export cables becoming exposed or as a result of interactions between fishing gear and protected sections of cables.
- 202. In order to assess the sea bed status, post-lay and burial inspection surveys may be undertaken after installation of cables. A cable burial plan will be required as part of the Deemed Marine Licence, as discussed in **section 13.3.3**.
- 203. In addition, the location of cable protection and crossings would be made available to fishing stakeholders and in line with standard oil and gas industry practice, in instances where cable protection is required, procedures would be carried out to ensure that the protection methods used are compatible with fishing activities where feasible and practical.

- 204. Furthermore, as described in **Section 13.3.3** the required levels of information distribution would be undertaken through the channels of the Kingfisher Information System and Notices to Mariners, along with direct liaison with fishermen and their representatives. The primary purpose of this would be to ensure the appropriate awareness of potential risks amongst fishing vessel owners and crews.
- 205. In conclusion, with the implementation of the measures, on-going liaison with fishermen and information distribution discussed above, safety issues for fishing vessels are considered to be **broadly acceptable**.
- 206. Safety risks arising from the potential for collisions with operation and maintenance vessels and allision with project infrastructure are addressed in *Chapter 14 Shipping and Navigation*. A separate assessment of potential safety issues associated with seabed obstacles is provided in *section 13.6.2.7*.

### 13.6.2.7 Impact 7: Seabed Obstacles

207. With compliance with the obligations and monitoring and policies discussed above for the construction phase (**section 13.6.1.7**), risks associated with obstacles on the seabed should remain **broadly acceptable**. In instances of objects accidently dropped overboard the standard requirements of reposition recording and recovery will apply. In addition, snagging and loss of gear protocols will be developed by the Applicant, as discussed in **section 13.3.3**.

### 13.6.3 Potential Impacts during Decommissioning

- 208. The scope of the decommissioning works would be determined by the relevant legislation and guidance at the time of decommissioning and would most likely involve the accessible installed components. Offshore this is likely to include; all of the wind turbine components, part of the foundations (those above sea bed level) and the sections of the inter-array cables close to the offshore structures, as well as sections of the export cables.
- 209. With regards to offshore cabling, general UK practice would be followed i.e. buried cables would simply be cut at the ends and left in-situ.
- 210. It is therefore anticipated that the impacts during decommissioning will be temporary and similar to those identified for the construction phase. This would be as follow:
  - Impact 1: Potential impacts on commercially exploited fish and shellfish populations;
  - Impact 2: Temporary loss or restricted access to traditional fishing grounds;
  - Impact 3: Displacement of fishing activity into other areas;
  - Impact 4: Increased steaming times to fishing grounds;

- Impact 5: Interference with fishing activity;
- Impact 6: Safety issues for fishing vessels; and
- Impact 7: Obstacles on the seabed.
- 211. Throughout decommissioning the sensitivity of receptors is assumed to be the same as for the construction phase. The magnitude of effect is considered to be the same as, and in all likelihood less, than that assigned for the construction phase. Consequently, potential impacts to fishing fleets during decommissioning are expected to be no greater, and probably less than those assessed for the construction phase.

### 13.7Cumulative Impacts

- 212. The following section provides an assessment of the potential cumulative impacts of the operation, construction and decommissioning phase of the proposed East Anglia ONE North project with other marine developments.
- 213. The potential impacts considered for cumulative assessment are in line with those described above for assessment of the proposed East Anglia One North project alone and include the following:
  - Impact 1: Potential impacts of commercially exploited fish and shellfish species;
  - Impact 2: Loss or restricted access to traditional fishing grounds;
  - Impact 3: Displacement of fishing activity into other areas.
  - Impact 4: Increased steaming times to fishing grounds; and
  - Impact 5: Interference with fishing activities;
- 214. In the case of safety issues for fishing vessels (Impact 6) and obstacles on the seabed (Impact 7), it is considered that the same obligations discussed for the proposed East Anglia ONE North project alone would apply to other projects / activities, negating the potential for cumulative impacts to occur. As such, these potential impacts are not discussed further in this section.
- 215. The potential for cumulative impacts to occur would depend on the operating patterns of and the location of preferred fishing grounds of each fleet in relation to other marine developments. Given the large operational range of some fishing fleets, this assessment considers other marine developments over a wide area, including the wider North Sea and English Channel.
- 216. Marine projects/activities with potential to result in cumulative impacts on commercial fisheries include other offshore wind farms, aggregate dredging, oil

- and gas activity and fishing restrictions associated with the introduction of Marine Protected Areas (MPAs).
- 217. For the purposes of this assessment it is taken that currently operational offshore wind farms, active licenced activities and implemented measures are part of the existing environment, as commercial fishing activity would already be adapted to them. In addition, any effect they might have had would be reflected in the baseline characterisation used to inform this chapter (*Appendix 13.1*).
- 218. With regards to oil and gas activity it should be noted that whilst new areas are being licenced there is currently no information on if or when these blocks will be developed. In addition, a significant amount of oil and gas infrastructure is entering decommissioning and removal phases which, once complete, may lead to some increase in fishable areas. Given the limitations noted above, oil and gas activities have not been included in the cumulative assessment.
- 219. Offshore wind farms, aggregate dredging areas and MPAs considered in the cumulative assessment are outlined in **Table 13.15** and illustrated in **Figure 13.40 and Figure 13.41**.
- 220. In respect of MPAs, it should be noted that the final boundaries of some of these have not been finalised and therefore in some cases the published boundaries are only indicative of their maximum possible extent. In addition, the nature and specific areas within MPAs where potential restrictions on fishing activity may be applied are in most cases also yet to be defined or finalised.
- 221. In the case of aggregate dredging areas, it should be recognised that only a small percentage of these areas would be actively dredged at any one time.
- 222. The same receptor sensitivities identified for assessment of the East Anglia ONE North project alone apply for assessment of cumulative impacts. Therefore, reference is made to the sensitivity levels identified for assessment of East Anglia ONE North alone (**Section 13.6**) across the cumulative assessment as appropriate.

Table 13.15Summary of Projects considered for the CIA in Relation to Commercial Fisheries

| Project               | Project status       | Distance from site (km) |
|-----------------------|----------------------|-------------------------|
| East Anglia TWO       | In Planning (scoped) | 10                      |
| UK offshore windfarms |                      |                         |
| Beatrice              | Under Construction   | 720                     |
| Galloper              | Under Construction   | 39                      |
| Rampion               | Under Construction   | 251                     |

| Project   | Project status         | Distance from site (km) |  |
|---|------------------------|-------------------------|--|
| East Anglia One                                     | Under Construction     | 1                       |  |
| Hornsea Project One                                 | Under Construction     | 154                     |  |
| Hywind 2 Demonstration                              | Under Construction     | 608                     |  |
| Aberdeen Offshore Wind Farm                         | Under Construction     | 599                     |  |
| East Anglia THREE                                   | Consented              | 17                      |  |
| Hornsea Project Two                                 | Consented              | 162                     |  |
| Dogger Bank Teeside A                               | Consented              | 281                     |  |
| Sophia (Formerly Dogger Bank<br>Teeside B)          | Consented              | 267                     |  |

### 13.7.1 Cumulative Impacts during Construction

223. The assessment of cumulative impacts during the construction phase takes account of the potential increase in the spatial extent of the impact (where construction at various projects occurs concurrently) but also of the potential increase in the duration of the impact (where construction at different projects occurs sequentially).

## 13.7.1.1 Impact 1: Potential Impacts on Commercially Exploited Fish and Shellfish Species

224. There may be potential for the construction of the proposed East Anglia ONE North project in conjunction with construction activities at other projects to result in cumulative impacts on fish and shellfish populations. This could in turn indirectly affect the productivity of the fisheries that target them. The potential cumulative impacts of construction of the proposed East Anglia ONE North project on fish and shellfish species, including those of commercial importance, are assessed in *Chapter 10 Fish and Shellfish Ecology* and are not expected to exceed minor adverse significance. Consequently, any cumulative impacts on the commercial fisheries that target them are also not expected to exceed minor adverse significance.

### 13.7.1.2 Impact 2: Loss or Restricted Access to Traditional Fishing Grounds

### 13.7.1.2.1 Dutch Fishing Vessels

Dutch beam trawling

- 225. Fishing activity by Dutch beam trawlers occurs at relatively high intensity across the majority of the Southern North Sea with the highest levels of activity recorded along the Dutch and Belgian coasts. Some activity also occurs in the Central North Sea, however at lower levels (*Figure 13.7 and Figure 13.8*).
- 226. Construction activities in other offshore windfarm projects, aggregate dredging activity and fishing restrictions associated with MPAs, particularly in the Southern North Sea (*Figure 13.40*), would therefore have the greatest potential to add to cumulative impacts with regards to loss of fishing grounds on this fleet. Recognising the increased area potentially affected /duration of the impact and taking account of the wide extent of fishing grounds available to this fleet, the magnitude of the cumulative effect is considered medium.
- 227. As discussed for the proposed East Anglia ONE North project alone, the sensitivity of Dutch beam trawlers to loss of fishing grounds is low (**Section 13.6**) This, combined with the medium magnitude of effect results in a cumulative impact of **minor adverse** significance.

### Dutch seine netting

228. Dutch seine netting activity is widespread throughout the North Sea from the northern coast of Denmark and is highest in the English Channel (*Figure 13.10* 

- and Figure 13.11). Construction activities in other offshore windfarm projects, aggregate dredging activity and fishing restrictions associated with MPAs in these areas (Figure 13.40) would have the greatest potential to add to cumulative impacts in respect of loss of fishing grounds to this fleet.
- 229. Acknowledging the increase in the area of grounds potentially lost and/or in the duration of exclusion and recognising the wide operational range and extent of grounds of this fleet, the magnitude of the effect is considered to be medium.
- 230. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of the Dutch seine netting fleet to loss of fishing grounds is low. This combined with the medium magnitude of effect identified above results in a cumulative impact of **minor adverse** significance.

### Other Dutch fishing methods

- 231. Activity by Dutch vessels operating demersal otter trawls, pelagic trawls, purse seine nets, dredges, nets and traps is very low/absent in the vicinity of the offshore development area (*Figure 13.12 to Figure 13.19*). Consequently, the potential contribution of construction works in the proposed East Anglia ONE North project to any cumulative impact on this fleet would be minimal. With this in mind the magnitude of the effect is considered to be negligible.
- 232. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of vessels operating demersal and pelagic trawls is considered to be low. In the case of vessels operating dredges, purse seines, nets and traps, the sensitivity is considered medium.
- 233. Taking this together with the negligible magnitude of the effect identified above, the cumulative impact of loss of grounds is considered to be of **negligible** significance.

### Belgian beam trawlers

- 234. The fishing grounds of Belgian beam trawlers cover substantial areas of the Southern North Sea, English Channel and Celtic Sea and parts of the Central North Sea and the Irish Sea (*Figure 13.22 to Figure 13.23*).
- 235. Construction activities in other windfarm projects, aggregate dredging activity and fishing restrictions associated with MPAs, particularly in areas of high fishing intensity, would have the greatest potential to contribute to cumulative impacts in respect of loss of fishing grounds on this fleet. Acknowledging the increase in the area of grounds potentially lost and/or in the duration of exclusion, when taking account of other projects/activities (*Figure 13.40*), but recognising the wide operational range and extent of grounds of this fleet, the magnitude of the effect is considered to be medium.

236. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of the Belgian beam trawlers to loss of fishing grounds is low. This combined with the medium magnitude of effect identified above results in a cumulative impact of **minor adverse** significance.

### Belgian demersal otter trawling

- 237. Activity by Belgian otter trawlers takes place over wide areas of the Central and Southern North Sea, the English Channel, the Celtic Sea and the Irish Sea and occurs at very low levels in the offshore development area (*Figure 13.23 and Figure 13.24*). Consequently, the potential contribution of construction works in the proposed East Anglia ONE North project to any cumulative impact on this fleet would be minimal. With this in mind the magnitude of the effect is considered to be negligible.
- 238. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of the Belgian otter trawlers to loss of fishing grounds is low. This combined with the negligible magnitude of effect identified above results in a cumulative impact of **negligible** significance.

### 13.7.1.2.2United Kingdom Fishing Vessels

### Local inshore fleet

- 239. The majority of local UK vessels active in the vicinity of the offshore development area are of under 10m in length and primarily exploit grounds within the 12nm (and mostly within the 6nm limit). Therefore, construction activities at other offshore windfarms located in the proximity of the proposed East Anglia ONE North project (i.e. East Anglia ONE, East Anglia THREE and East Anglia TWO), particularly export cable installation, would have the greatest potential to result in cumulative impacts on this fleet (*Figure 13.42*) (both whether construction occurs concurrently or sequentially).
- 240. In this context it is important to note, however, that in line with the approach taken for the proposed East Anglia ONE North project, it would be assumed that where relocation of gear during construction is required for other projects, evidence-based mitigation following FLOWW guidelines would be applied.
- 241. In addition to works at other offshore wind farms, there may be potential for aggregate dredging activity in areas in the proximity of the offshore development area (*Figure 13.42* and *Table 13.15*) to add to cumulative impacts on this fleet. Any loss of grounds associated with aggregate dredging would however be expected to be short term and localised as discussed in paragraph 221. Given the static nature of the gear used by the majority of the inshore fleet, it is unlikely that restrictions to fishing associated with MPAs would add significantly to cumulative impacts, as the focus of these restrictions tends to be

- on vessels operating towed rather than static gear. Furthermore, restrictions associated with this are expected to be implemented in discrete areas (i.e. where sensitive features are present), rather than across the totality of the MPAs.
- 242. With the above considerations in mind the magnitude of the cumulative effect on the local inshore fleet is considered to be low.
- 243. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**) the sensitivity of local inshore vessels to loss of fishing grounds is considered to be medium. This, combined with the low magnitude of the effect identified above, results in a cumulative impact of **minor adverse** significance.

### Other UK Vessels

- 244. With regards to UK vessels other than those that form part of the local inshore fleet, as mentioned in *Section 13.5.2*, in areas relevant to the proposed East Anglia ONE North project activity is primarily by beam trawlers. The majority of these are Anglo-Dutch vessels which operate over wide areas in the Southern and Central North Sea (*Figure 13.32 and Figure 13.33*). Construction activities in other projects, aggregate dredging activity and fishing restrictions associated with MPAs in these areas (*Figure 13.41*) would therefore have the greatest potential to contribute to cumulative impacts.
- 245. Acknowledging the potential increase in the area of grounds potentially lost and/or in the duration of exclusion, when taking account of other projects/activities, but recognising the wide operational range and extent of grounds of the Anglo-Dutch fleet, the magnitude of the effect is considered to be medium.
- 246. In the case of beam trawlers operating from south-west ports, given the minimal activity of these vessels in the study area, the potential contribution of construction works in the proposed East Anglia ONE North project to any cumulative impact on this fleet would be minimal. With this in mind the magnitude of the effect is considered to be negligible for these vessels.
- 247. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of the UK beam trawlers (both Anglo-Dutch and south-west ports vessels) to loss of fishing grounds is low. This combined with the magnitude of effect identified above results in a cumulative impact of **minor adverse** significance in the case of Anglo-Dutch vessels and of **negligible** significance in the case of beam trawlers from south-west ports.

### 13.7.1.2.3French Fishing Vessels

248. From consultation and available data (*Appendix 13.1 Commercial Fisheries Technical Report*) it is apparent that French fishing activity levels in the

- offshore development area are relatively low with the majority of activity concentrating in areas south of the proposed East Anglia ONE North project towards the English Channel. Construction activities in other windfarm projects, aggregate dredging activity and fishing restrictions associated with MPAs in these areas would therefore have the greatest potential to contribute to cumulative impacts on this fleet (*Figure 13.41*).
- 249. Recognising the increase in the area of grounds potentially lost and/or in the duration of exclusion when taking account of other projects/activities, but recognising the wide operational range and extent of grounds of this fleet, the magnitude of the effect is considered to be medium.
- 250. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**) the sensitivity of French pelagic and demersal trawlers to loss of fishing grounds is considered to be low. This, combined with the medium magnitude of the effect identified above, results in a cumulative impact of **minor adverse** significance.

#### 13.7.1.2.4Danish Fishing Vessels

- 251. Activity by both Danish pelagic trawlers and sandeel trawlers is widespread throughout the North Sea with high areas of activity on the Danish coast and Central North Sea. By comparison (*Figure 13.38 and Figure 13.39*), activity levels by these fleets is very low in the study area.
- 252. Consequently, the potential contribution of construction works in the proposed East Anglia ONE North project to any cumulative impact on this fleet would be minimal. With this in mind the magnitude of the effect is considered to be negligible.
- 253. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of the Danish sandeel and pelagic trawlers to loss of fishing grounds is low. This combined with the negligible magnitude of effect identified above results in a cumulative impact of **negligible** significance.

#### 13.7.1.2.5German Fishing Vessels

- 254. Analysis of available VMS data for German vessels (*Figure 13.40*) suggests low levels of fishing activity occur in areas relevant to the East Anglia ONE North offshore windfarm site, with activity concentrating for the most part in the Dutch and Danish Sector of the Central North Sea. Construction activities in other windfarm projects, aggregate dredging activity and fishing restrictions associated with MPAs in in these areas would therefore have the greatest potential to contribute to cumulative impacts on this fleet (*Figure 13.41*).
- 255. Recognising the increase in the area of grounds potentially lost and/or in the duration of exclusion when taking account of other projects/activities, but

- recognising the wide operational range and extent of grounds of this fleet, the magnitude of the effect is considered to be medium.
- 256. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of the German beam trawlers to loss of fishing grounds is low. This combined with the medium magnitude of effect identified above results in a cumulative impact of **minor adverse** significance.

#### 13.7.1.3 Impact 3: Displacement of Fishing Activity into Other Areas

- 257. During construction, loss of fishing grounds to local inshore vessels could result in displacement of fishing activity into other areas. This in turn, could cause an increase in competition between local inshore vessels for fishing grounds.
- 258. Given that the activity of local UK vessels is predominately focussed inshore and their operational range is relatively small, for the most part construction activities at other offshore windfarms located in the proximity of the proposed East Anglia ONE North project (i.e. East Anglia THREE and East Anglia TWO), particularly export cable installation, would have the greatest potential to result in cumulative impacts on this fleet (*Figure 13.41*) (both whether construction occurs concurrently or sequentially).
- 259. As mentioned above in respect of loss of grounds, however, it should be noted that in line with the approach taken for the East Anglia ONE North project (see paragraph 107), it would be expected that where relocation of gear during construction is required for other projects, evidence-based mitigation following FLOWW Guidelines would be applied.
- 260. In addition to works at other offshore wind farms, there may be potential for aggregate dredging activity in areas in the proximity of the offshore development area (*Figure 13.41*) to add to cumulative impacts on this fleet. Any loss of grounds and associated displacement as a result of aggregate dredging activity would however be expected to be short term and localised. Given the static nature of the gear used by the majority of the inshore fleet, it is unlikely that restrictions to fishing associated with MPAs would add significantly to cumulative impacts in respect of displacement, as the focus of these restrictions tends to be on vessels operating towed rather than static gear. Furthermore, restrictions associated with this would be expected to be only implemented in discrete areas (i.e. where sensitive features are present), rather than across the totality of the MPAs.
- 261. With the above considerations in mind the magnitude of the cumulative effect on the local inshore fleet is considered to be low.
- 262. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of local inshore vessels to displacement is considered to

- be medium. This combined with the low magnitude of the effect identified above results in a cumulative impact of **minor adverse** significance.
- 263. In respect of vessels operating towed gear, as outlined for the proposed East Anglia ONE North project alone (**Section 13.6**), it is considered that the sensitivity of the receptors, magnitude of the effect and resulting impact significance would, at worst, be as identified in relation to cumulative loss or restricted access to fishing grounds (**Section 13.7.1.2**). As summarised in **Table 13.16**, this would result in an impact of **negligible to minor adverse** significance, depending on the fleet under consideration.

Table 13.16 Impact significance of displacement of fishing activity into other areas for vessels

operating towed gears

| Receptor Group  | Receptor Group                          |        | Magnitude of<br>Effect | Impact<br>Significance |

| German fishing v  | essels                                  | Low    | Medium                 | Minor adverse          |

#### 13.7.1.4 Impact 4: Increased Steaming Times to Fishing Grounds

- 264. There is potential for the safety zones applied during construction of the proposed East Anglia ONE North project together with those associated with other projects included in the cumulative assessment (*Table 13.15, Figure 13.40* and *Figure 13.41*) to result in increased steaming times for fishing vessels.
- 265. Whilst the potential increase in areas with safety zones in place at any given time due to construction activities at other projects is recognised, considering

- the relatively small footprint of these zones the magnitude of the impact is considered to be low.
- 266. As discussed for the proposed East Anglia ONE North project alone (Section 13.6), the sensitivity of local inshore vessels to increased steaming times is considered to be low, whilst for the remaining fleets it is considered to be negligible. This, combined with the magnitude of effect identified above, results in an impact of minor adverse significance for the local inshore fleet and of negligible significance for the remaining of the fleets.

#### 13.7.1.5 Impact 5: Interference with Fishing Activities

- 267. The increase in vessel movements associated with the construction phase of the proposed East Anglia ONE North project together with other projects could result in cumulative impacts in terms of interference with fishing activities.
- 268. It should be noted, however, that it in line with the approach proposed for the proposed East Anglia ONE North project, it would be expected that appropriate liaison enabling awareness to vessels in transit on the location of static gear and fishermen's awareness of vessel transit routes, would be undertaken at the other projects included in the assessment to minimise potential interference. In the case of towed gears, the same obligations in respect of COLREGS outlined in **Section 13.6**, would also apply to other projects. Whilst the relative increase in the level of vessel transits resulting from the proposed East Anglia ONE North project in conjunction with other projects is recognised, with the appropriate two way liaison with fishermen and adherence to COLREGs obligations as outlined above, the magnitude of the effect is considered to be low.
- 269. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of vessels operating static gear is considered to be medium and that of vessels operating towed gear is considered to be low. This, in combination with the magnitude of effect identified above results in a cumulative impact of **minor adverse** significance.

#### 13.7.2 Cumulative Impacts during Operation

- 13.7.2.1 Impact 1: Potential Impacts on Commercially Exploited Fish and Shellfish Species
- 270. There may be potential for the operational phase of the proposed East Anglia ONE North project in conjunction with other projects to result in cumulative impacts on fish and shellfish populations. This could in turn indirectly affect the productivity of the fisheries that target them. The potential cumulative impacts of the operational phase of the proposed East Anglia ONE North project on fish and shellfish species, including those of commercial importance, are assessed in *Chapter 10 Fish and Shellfish Ecology* and are not expected to exceed

minor adverse significance. Consequently, any impacts on the commercial fisheries that target them are also not expected to exceed **minor adverse** significance.

## 13.7.2.2 Impact 2: Loss or Restricted Access to Traditional Fishing Grounds 13.7.2.2.1 Dutch Fishing Vessels

Dutch beam trawlers

- 271. Given the location of preferred fishing grounds for this fleet *Figure 13.7 and Figure 13.8*, wind farm projects, aggregate dredging activity and fishing restrictions associated with MPAs, particularly in the Southern North Sea (*Figure 13.40*), would have the greatest potential to add to cumulative impacts with regards to loss of fishing grounds during the operation phase of the proposed East Anglia ONE North project.
- 272. With the exception of windfarms in countries where fishing in operational sites is not permitted (i.e. Holland and Belgium) or where restrictions on towed gear fishing inside operational sites may be applied, Dutch beam trawlers would be expected to have access to offshore windfarms once operational. With regards to restrictions associated with MPAs, the localised nature of likely restrictions on fishing should be recognised. In the case of aggregate dredging activity, its temporary and localised nature should be acknowledged.
- 273. Recognising the increased area potentially affected and considering the extent of fishing grounds available to this fleet (*Figure 13.7 and Figure 13.8*) the magnitude of the cumulative effect is considered medium.
- 274. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of Dutch beam trawlers to loss of fishing grounds is considered to be low. This, together with the medium magnitude of the effect identified above results in an impact of **minor adverse** significance.

#### Dutch seine nettina

- 275. Fishing activity by Dutch seine netters in the Southern and Central North Sea occurs at considerably lower levels than beam trawling. The highest levels of activity concentrate south of the offshore development area, around the English Channel. Other wind farm projects, aggregate dredging activity and fishing restrictions associated with MPAs, particularly in these areas would therefore have the greatest potential to add to cumulative impacts with regards to loss of fishing grounds (*Figure 13.40*).
- 276. As previously mentioned, seine netters are not expected to be able to deploy gear within operational windfarms. As described above for Dutch beam trawlers, with regards to restrictions associated with MPAs, the localised nature of likely restrictions on fishing should be recognised. In the case of aggregate

- dredging activity, its temporary and localised nature should also be acknowledged.
- 277. Considering the above and taking account of the extent of the grounds available to this fleet, the magnitude of the effect is considered to be medium.
- 278. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of Dutch seine netters to loss of fishing grounds is considered to be low. This, together with the medium magnitude of the effect identified above results in a cumulative impact of **minor adverse** significance.

#### Other Dutch methods

- 279. Activity by Dutch vessels operating demersal otter trawls, pelagic trawls, purse seine nets, dredges, nets and traps is very low/absent in the vicinity of the offshore development area (*Figure 13.12 to Figure 13.19*). Consequently, the potential contribution of the operational phase of the proposed East Anglia ONE North project to any cumulative impact on this fleet would be minimal. With this in mind the magnitude of the effect is considered to be negligible.
- 280. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of vessels operating demersal and pelagic trawls is considered to be low. In the case of vessels operating dredges, purse seines, nets and traps, the sensitivity is considered medium.
- 281. Taking this together with the negligible magnitude of the effect identified above, the cumulative impact of loss of grounds is considered to be of **negligible** significance.

#### 13.7.2.2.2Belgian Fishing Vessels

#### Belgian beam trawlers

- 282. The fishing grounds of Belgian beam trawlers cover substantial areas of the Southern North Sea, English Channel and Celtic Sea and parts of the Central North Sea and the Irish Sea (*Figure 13.22 to Figure 13.23*). Other wind farm projects, aggregate dredging activity and fishing restrictions associated with MPAs in these areas would therefore have the greatest potential to add to cumulative impacts with regards to loss of fishing grounds (*Figure 13.41*).
- 283. With the exception of windfarms in countries where fishing in operational sites is not permitted (i.e. Holland and Belgium) or where restrictions on towed gear fishing inside operational sites may be applied, Belgian beam trawlers would be expected to have access to offshore windfarms once operational. With regards to restrictions of MPAs, as previously mentioned, the localised nature of likely restrictions on fishing should be recognised. In the case of aggregate dredging activity, its temporary and localised nature should also be acknowledged.

- 284. Taking the increased area potentially affected and considering the extent of fishing grounds available to this fleet (*Figure 13.7 and Figure 13.8*) the magnitude of the cumulative effect is considered medium.
- 285. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of the Belgian beam trawlers to loss of fishing grounds is low. This combined with the medium magnitude of effect identified above results in a cumulative impact of **minor adverse** significance.

#### Belgian demersal otter trawling

- 286. Activity by Belgian otter trawlers takes place over wide areas of the Central and Southern North Sea, the English Channel, the Celtic Sea and the Irish Sea and occurs at very low levels in the offshore development area (*Figure 13.23 and Figure 13.24*). Consequently, the potential contribution of the operational phase of the proposed East Anglia ONE North project to any cumulative impact on this fleet would be minimal. With this in mind the magnitude of the effect is considered to be negligible.
- 287. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of the Belgian otter trawlers to loss of fishing grounds is low. This combined with the negligible magnitude of effect identified above results in a cumulative impact of **negligible** significance.

#### 13.7.2.2.3United Kingdom Vessels

#### Local inshore fleet

- 288. The majority of activity by local inshore vessels is within 12nm of the UK coast (and mostly within 6nm). Offshore windfarms, aggregate dredging activity and MPAs in these areas, would therefore have the greatest potential to contribute to cumulative loss of fishing grounds to this fleet.
- 289. In respect of other offshore windfarms, key projects with potential to result in cumulative impacts on the local inshore fleet are those in the vicinity of the proposed East Anglia ONE North project, namely East Anglia ONE, East Anglia TWO and East Anglia THREE (*Figure 13.42*). It should be noted, however, that once operational, fishing by local inshore vessels would be expected to able to resume over the export cables of these windfarms as prior to their installation. Similarly, fishing would be able to resume within the windfarm arrays, although it is recognised that some methods, such as longlining and netting, may need to modify their mode of operation.
- 290. With regards to aggregate dredging activity, whilst it could contribute to cumulative impacts, as previously mentioned, its temporary and localised nature should be acknowledged.

- 291. Given the static nature of the gear used by the majority of the inshore fleet, it is unlikely that restrictions to fishing associated with MPAs would add significantly to cumulative impacts, as the focus of these restrictions tends to be on vessels operating towed rather than static gear. Furthermore, restrictions associated with this are expected to be implemented in discrete areas (i.e. where sensitive features are present), rather than across the totality of a given MPA.
- 292. With the above considerations in mind, the magnitude of the cumulative impact is considered to be low.
- 293. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of the local inshore fleet to loss of fishing grounds is medium. This, in combination with the low magnitude of effect identified above, results in a cumulative impact of **minor adverse** significance.

#### Other UK Vessels

- 294. With regards to UK vessels other than those that form part of the local inshore fleet, as mentioned in **Section 13.5.2**, in areas relevant to the proposed East Anglia ONE North project activity is primarily by beam trawlers. The majority of these are Anglo-Dutch vessels which operate over wide areas in the Southern and Central North Sea (**Figure 13.32 and Figure 13.33**). Offshore windfarms, aggregate dredging activity and MPAs in these areas, would therefore have the greatest potential to contribute to cumulative loss of fishing grounds to this fleet (**Figure 13.41**).
- 295. With the exception of windfarms in countries where fishing in operational sites is not permitted (i.e. Holland and Belgium) or where restrictions on towed gear fishing inside operational sites may be applied, Anglo-Dutch beam trawlers would be expected to have access to offshore windfarms once operational. With regards to restrictions of MPAs, as previously mentioned, the localised nature of likely restrictions on fishing should be recognised. In the case of aggregate dredging activity, its temporary and localised nature should also be acknowledged.
- 296. Taking the increased area potentially affected and considering the extent of fishing grounds available to this fleet (*Figure 13.32 and Figure 13.33*) the magnitude of the cumulative effect is considered medium.
- 297. In the case of beam trawlers operating from south-west ports, given the minimal activity of these vessels in the study area, the potential contribution of the operational phase of the proposed East Anglia ONE North project to any cumulative impact on this fleet would be minimal. With this in mind the magnitude of the effect is considered to be negligible for these vessels.

298. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of the UK beam trawlers (both Anglo-Dutch and south-west ports vessels) to loss of fishing grounds is low. This combined with the magnitude of effect identified above results in a cumulative impact of **minor adverse** significance in the case of Anglo-Dutch vessels and of **negligible** significance in the case of beam trawlers from south-west ports.

#### 13.7.2.2.4French Fishing Vessels

- 299. From consultation and available data (*Appendix 13.1 Commercial Fisheries Technical Report*) it is apparent that French fishing activity levels in the offshore development area are relatively low with the majority of activity concentrating in areas south of the proposed East Anglia ONE North project towards the English Channel. Offshore windfarms, aggregate dredging activity and MPAs in these areas, would therefore have the greatest potential to contribute to cumulative loss of fishing grounds to this fleet (*Figure 13.40*).
- 300. With the exception of windfarms in countries where fishing in operational sites is not permitted (i.e. Holland and Belgium) or where restrictions on towed gear fishing inside operational sites may be applied, French trawlers would be expected to have access to offshore windfarms once operational. With regards to restrictions of MPAs, as previously mentioned, the localised nature of likely restrictions on fishing should be recognised. In the case of aggregate dredging activity, its temporary and localised nature should also be acknowledged.
- 301. Taking the increased area potentially affected and considering the extent of fishing grounds available to this fleet (*Figure 13.33 and Figure 13.36*) the magnitude of the cumulative effect is considered medium.
- 302. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of the French demersal and pelagic trawlers to loss of fishing grounds is low. This combined with the magnitude of effect identified above results in a cumulative impact of **minor adverse** significance

#### 13.7.2.2.5 Danish Fishing Vessels

- 303. Activity by both Danish pelagic trawlers and sandeel trawlers is widespread throughout the North Sea with high areas of activity on the Danish coast and Central North Sea. By comparison (*Figure 13.37 and Figure 13.38*), activity levels by these fleets is very low in the study area.
- 304. Consequently, the potential contribution of the operational phase of proposed East Anglia ONE North project to any cumulative impact on this fleet would be minimal. With this in mind the magnitude of the effect is considered to be negligible.

305. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of the Danish sandeel and pelagic trawlers to loss of fishing grounds is low. This combined with the negligible magnitude of effect identified above results in a cumulative impact of **negligible** significance.

#### 13.7.2.2.6German Fishing Vessels

- 306. Analysis of available VMS data for German vessels (*Figure 13.39*) suggests low levels of fishing activity occur in areas relevant to the East Anglia ONE North offshore windfarm site, with activity concentrating for the most part in the Dutch and Danish Sector of the Central North Sea. Offshore windfarms, aggregate dredging activity and MPAs in these areas, would therefore have the greatest potential to contribute to cumulative loss of fishing grounds to this fleet (*Figure 13.40*).
- 307. With the exception of windfarms in countries where fishing in operational sites is not permitted (i.e. Holland and Belgium) or where restrictions on towed gear fishing inside operational sites may be applied, German beam trawlers would be expected to have access to offshore windfarms once operational. With regards to restrictions of MPAs, as previously mentioned, the localised nature of likely restrictions on fishing should be recognised. In the case of aggregate dredging activity, its temporary and localised nature should also be acknowledged.
- 308. Taking the increased area potentially affected and considering the extent of fishing grounds available to this fleet (*Figure 13.39*) the magnitude of the cumulative effect is considered medium.
- 309. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of the German vessels to loss of fishing grounds is low. This combined with the magnitude of effect identified above results in a cumulative impact of **minor adverse** significance

#### 13.7.2.3 Impact 3: Displacement of Fishing Activity into other Areas

- 310. During operation, the cumulative loss of fishing grounds to local inshore vessels could result in a displacement of fishing activity into other areas. This in turn, could cause an increase in competition between local inshore vessels for fishing grounds.
- 311. In respect of other offshore windfarms, key projects with potential to result in displacement impacts on the local inshore fleet are those in the vicinity of the proposed East Anglia ONE North project, namely East Anglia ONE, East Anglia TWO and East Anglia THREE (*Figure 13.41*). It should be noted, however, that as previously mentioned, once operational, fishing by local inshore vessels would be expected to able to resume over the export cables of these windfarms

as prior to their installation. Similarly, fishing would be able to resume within the windfarm arrays, although it is recognised that some methods, such as longlining and netting may need to modify their mode of operation. The potential for displacement effects on local inshore fleet associated with offshore windfarms would therefore be very small.

- 312. Similarly, with regards to aggregate dredging activity, given its localised and short time nature any displacement effects on this fleet would be limited. In the particular case of displacement associated with loss of grounds as a result of restrictions on fishing implemented on MPAs, given the static nature of the gear used by the majority of the inshore fleet, it is unlikely that this would add significantly to cumulative impacts in respect of displacement, as the focus of these restrictions tends to be on vessels operating towed rather than static gear. Furthermore, restrictions associated with this would be expected to be only implemented in discrete areas (i.e. where sensitive features are present), rather than across the totality of the MPAs.
- 313. With this in mind the magnitude of the effect of displacement on the local inshore fleet is considered low.
- 314. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of local inshore vessels to displacement is considered to be medium. This combined with the low magnitude of the effect identified above results in a cumulative impact of **minor adverse** significance.
- 315. In respect of vessels operating towed gear, as outlined for the proposed East Anglia ONE North project alone (**Section 13.6**), it is considered that the sensitivity of the receptors, magnitude of the effect and resulting impact significance would, at worst, be as identified in relation to the loss or restricted access to fishing grounds (**Section 13.7.2.2**). As summarised in **Table 13.17**, this would result in an impact of negligible to minor adverse significance, depending on the fleet under consideration.

Table 13.17 Impact significance of displacement of fishing activity into other areas for vessels operating towed gears

| Receptor Group         |   | Receptor<br>sensitivity | Magnitude of<br>Effect | Impact<br>Significance |
|------------------------|---|-------------------------|------------------------|------------------------|
| Dutch Beam Trav        | wling                                   | Low                     | Medium                 | Minor adverse          |
| Dutch Seine Nett       | ing                                     | Low                     | Medium                 | Minor adverse          |
| Other Dutch<br>Methods | Demersal (otter) trawls, pelagic trawls | Low                     | Negligible             | Negligible             |
|                        | Nets, purse seines, traps and dredges   | Medium                  | Negligible             | Minor adverse          |

| Receptor Group  | Receptor<br>sensitivity | Magnitude of<br>Effect | Impact<br>Significance |
|---|-------------------------|------------------------|------------------------|
| Belgian Beam Trawling                                   | Low                     | Medium                 | Minor adverse          |
| Belgian Demersal Otter Trawling                         | Low                     | Negligible             | Negligible             |
| UK Beam Trawling (Anglo-Dutch)                          | Low                     | Medium                 | Minor adverse          |
| UK Beam Trawling (Southwest ports)                      | Low                     | Negligible             | Negligible             |
| French demersal and pelagic trawlers                    | Low                     | Medium                 | Minor adverse          |
| Danish sandeel industrial trawling and pelagic trawlers | Low                     | Negligible             | Negligible             |
| German fishing vessels                                  | Low                     | Medium                 | Minor adverse          |

#### 13.7.2.4 Impact 4: Increased Steaming Times to Fishing Grounds

- 316. The presence of installed infrastructure associated with the operation of the proposed East Anglia ONE North project together with that of other projects included in the cumulative assessment, could potentially result in increases in steaming times for some fishing vessels.
- 317. As described in *Chapter 14 Shipping and Navigation*, it is anticipated that during the operational phase, fishing vessels will be able to steam through the operational East Anglia ONE North windfarm site. This would also be expected to be the case for other projects. With, this in mind, the magnitude of the effect is considered to be negligible.
- 318. As discussed for the construction phase (**Section 13.6.1.4**), for local inshore vessels, the sensitivity to increased steaming times is considered to be low and for the remaining fleets is considered to be negligible. This, in combination with the negligible magnitude of the effect identified above results in a cumulative impact of **negligible** significance for the local inshore fleet and the remaining of fleets.

#### 13.7.2.5 Impact 5: Interference with Fishing Activities

- 319. The increase in vessel movements associated with the operation phase of the proposed East Anglia ONE North project together with vessels movements at other projects could result in cumulative impacts in terms of interference with fishing activities.
- 320. It should be noted, however, that as described above in respect of cumulative impacts for the construction phase (**Section 13.7.1.5**), it would be expected that appropriate liaison enabling awareness to vessels in transit on the location of static gear and fishermen's awareness of vessel transit routes, would be

undertaken at the other projects included in the assessment to minimise potential interference. In the case of towed gears, the same obligations in respect of COLREGS outlined in **Section 13.6**, would also apply to other projects. Whilst the relative increase in the level of vessel transits resulting from the proposed East Anglia ONE North project in conjunction with other projects is recognised, with the appropriate two way liaison with fishermen and adherence to COLREGs obligations as outlined above, the magnitude of the effect is considered to be low.

321. As discussed for the proposed East Anglia ONE North project alone (**Section 13.6**), the sensitivity of vessels operating static gear is considered to be medium and that of vessels operating towed gear is considered to be low. This, in combination with the magnitude of effect identified above results in a cumulative impact of **minor adverse** significance.

#### 13.7.3 Cumulative Impacts during Decommissioning

- 322. The scope of decommissioning works for other offshore windfarm projects is likely to be similar to that described in **Section 13.6.3** for the proposed East Anglia ONE North project.
- 323. It is therefore expected that cumulative impacts during decommissioning would be temporary and short term and similar to those identified in respect of the assessment of cumulative impacts during construction, namely:
  - Impact 1: Potential impacts on commercially exploited fish and shellfish populations;
  - Impact 2: Temporary loss or restricted access to traditional fishing grounds;
  - Impact 3: Displacement of fishing activity into other areas;
  - Impact 4: Increased steaming times to fishing grounds; and
  - Impact 5: Interference with fishing activity.
- 324. Throughout the decommissioning phase, the sensitivity of receptors is assumed to be the same as identified for assessment in respect of cumulative impacts during construction. Similarly, the magnitude of effect would be expected to be the same, and in all likelihood less, than that identified in respect of the construction phase. Consequently, cumulative impacts to fishing fleets during decommissioning are expected to be no greater, and probably less than those assessed for the construction phase.

#### 13.8Interactions

325. The impacts identified and assessed in this chapter have the potential to interact with each other, which could give rise to synergistic impacts as a result

of that interaction. The worst case impacts assessed within the chapter take these interactions into account and for the impact assessments are considered conservative and robust. For clarity, the areas of interaction between impacts are presented in *Table 13.18* along with an indication as to whether the interaction may give rise to synergistic impacts.

**Table 13.18 Interactions between impacts** 

| Potential interaction between impacts  |  |   |  |  |  |  |   |  |  |  |
|--|--|---|--|--|--|--|---|--|--|--|
| Construction   |  |   |  |  |  |  |   |  |  |  |
|  | Impact 1: Potential impacts on commercially exploited fish and shellfish populations | Impact 2: Temporary<br>loss or restricted<br>access to traditional<br>grounds | Impact 3:<br>Displacement of<br>fishing activity into<br>other areas | Impact 4:<br>Increased<br>steaming times to<br>fishing grounds | Impact 5:<br>Interference with<br>fishing activities | Impact 6:<br>Safety issues<br>for fishing<br>vessels | Impact 7:<br>Obstacles on<br>the seabed |  |  |  |
| Impact 1: Potential impacts on commercially exploited fish and shellfish populations | -  | No  | No   | No   | No   | No   | No                                      |  |  |  |
| Impact 2: Temporary<br>loss or restricted<br>access to traditional<br>grounds        | No   | -   | Yes  | No   | No   | No   | No                                      |  |  |  |
| Impact 3:<br>Displacement of<br>fishing activity into<br>other areas                 | No   | Yes   | -  | No   | No   | No   | No                                      |  |  |  |
| Impact 4: Increased steaming times to fishing grounds                                | No   | No  | No   | -  | No   | No   | No                                      |  |  |  |
| Impact 5: Interference with fishing activities                                       | No   | No  | No   | No   | -  | No   | No                                      |  |  |  |
| Impact 6: Safety issues for fishing vessels  | No   | No  | No   | No   | No   | -  | Yes                                     |  |  |  |
| Impact 7: Obstacles on the seabed  | No   | No  | No   | No   | No   | Yes  | -                                       |  |  |  |
| Operation  |  |   |  |  |  |  |   |  |  |  |
|  | Impact 1: Potential impacts on commercially exploited fish and shellfish populations | Impact 2: Complete<br>loss or restricted<br>access to traditional<br>grounds  | Impact 3:<br>Displacement of<br>fishing activity into<br>other areas | Impact 4:<br>Increased<br>steaming times to<br>fishing grounds | Impact 5:<br>Interference with<br>fishing activities | Impact 6:<br>Safety issues<br>for fishing<br>vessels | Impact 7:<br>Obstacles on<br>the seabed |  |  |  |

### **East Anglia ONE North Offshore Windfarm**

| Potential interaction between impacts  |    |     |     |    |    |     |     |  |  |
|--|----|-----|-----|----|----|-----|-----|--|--|
| Impact 1: Potential impacts on commercially exploited fish and shellfish populations | -  | No  | No  | No | No | No  | No  |  |  |
| Impact 2: Complete<br>loss or restricted<br>access to traditional<br>grounds         | No | -   | Yes | No | No | No  | No  |  |  |
| Impact 3:<br>Displacement of<br>fishing activity into<br>other areas                 | No | Yes | -   | No | No | No  | No  |  |  |
| Impact 4: Increased steaming times to fishing grounds                                | No | No  | No  | -  | No | No  | No  |  |  |
| Impact 5:<br>Interference with<br>fishing activities                                 | No | No  | No  | No | -  | No  | No  |  |  |
| Impact 6: Safety issues for fishing vessels  | No | No  | No  | No | No | -   | Yes |  |  |
| Impact 7: Obstacles on the seabed  | No | No  | No  | No | No | Yes | -   |  |  |

#### Decommissioning

It is anticipated that the decommissioning impacts will be similar in nature to those of construction.

#### 13.9Inter-relationships

- 326. From the assessment of impacts on commercial fisheries during the construction, operational and decommissioning phases of the proposed East Anglia ONE North project, there is the potential for impacts addressed in other PEI chapters to potentially augment impacts assessed for commercial fisheries and vice versa.
- 327. These inter-relationships are summarised in Table 13.19 below. No interrelationships have been identified where additional mitigation is required due to an accumulation of residual impacts on commercial fisheries.

| Table 13.19 Chapter topic inter-relationships   |  |   |  |  |  |  |  |  |
|---|--|---|--|--|--|--|--|--|
| Topic and description   | Related Chapter                          | Where addressed in this Chapter   |  |  |  |  |  |  |
| Impacts on commercially exploited fish and shellfish species  Impacts on fish and shellfish species of commercial importance could indirectly affect the fisheries that target them.  | Chapter 10 Fish and<br>Shellfish Ecology | Section 13.6.1.1, Section<br>13.6.2.1, Section 13.7.1.1 and<br>Section 13.7.2.1 |  |  |  |  |  |  |
| Increased steaming times  Potential increases in steaming times to fishing grounds would arise depending on the potential for fishing vessels to be able to transit the offshore development area during construction and operation   | Chapter 14 Shipping and<br>Navigation    | Section 13.6.1.4, Section 13.6.2.4, Section 13.7.1.4 and Section 13.7.2.4.      |  |  |  |  |  |  |
| Safety issues for fishing vessels  In addition to safety issues for fishing vessels arising from snagging risks, manoeuvrability hindrances and seabed obstacles (addressed in this chapter), fishing vessels would also be affected by safety issues associated with potential for collision or allision with project vessels and infrastructure. These are addressed in <i>Chapter 14 Shipping and Navigation</i> . | Chapter 14 Shipping and Navigation       | Section 13.6.1.6, Section 13.6.1.7, Section 13.6.2.6 and Section 13.6.2.7.      |  |  |  |  |  |  |

#### **13.10Summary**

328. A summary of the outcome of the assessment of the impacts of the proposed East Anglia ONE North project alone and cumulative with other projects on commercial fisheries receptors is given in *Table 13.20* and *Table 13.21*, respectively.

**Table 13.20 Potential Impacts Identified for Commercial Fisheries Receptors** 

| Potential Impact   | Receptor   | Sensitivity   | Magnitude  | Significance     | Mitigation | Residual Impact |
|--|--|---------------|------------|------------------|------------|-----------------|
| Construction   |  |               |            |                  |            |                 |
| Impact 1: Potential impacts on commercially exploited fish and shellfish species |  | Shellfish Eco | logy       | Minor adverse    | N/A        | Minor adverse   |
| Impact 2: Temporary loss   |  | Low           | Low        | Minor adverse    | N/A        | Minor adverse   |
| or restricted access to fishing grounds  | Dutch seine netters  | Low           | Low        | Minor adverse    | N/A        | Minor adverse   |
|  | Other Dutch methods  | Low           | Negligible | Negligible       | N/A        | Negligible      |
|  | Belgian beam trawlers  | Low           | Low        | Minor adverse    | N/A        | Minor adverse   |
|  | Belgian otter trawlers   | Low           | Negligible | Negligible       | N/A        | Negligible      |
|  | UK local inshore fleet in general  | Medium        | Low        | Minor adverse    | N/A        | Minor adverse   |
|  | UK local inshore vessels with high dependence on the offshore development area |               | Medium     | Moderate adverse | N/A        | Minor adverse   |
|  | Anglo-Dutch beam trawlers  | Low           | Low        | Minor adverse    | N/A        | Minor adverse   |
|  | UK beam trawlers from south-west ports   | Low           | Negligible | Negligible       | N/A        | Negligible      |
|  | French pelagic and demersal trawlers   | Low           | Low        | Minor adverse    | N/A        | Minor adverse   |

| Potential Impact   | Receptor                            | Sensitivity     | Magnitude  | Significance       | Mitigation | Residual Impact    |
|--|-------------------------------------|-----------------|------------|--------------------|------------|--------------------|
|  | Danish sandeel and pelagic trawlers | Low             | Negligible | Negligible         | N/A        | Negligible         |
|  | German beam trawlers                | Low             | Low        | Minor adverse      | N/A        | Minor adverse      |
| Impact 3: Displacement of fishing activity into other areas                      | As above for Impact 2               |                 |            |                    |            |                    |
| Impact 4: Increased  | Local inshore fleet                 | Low             | Low        | Minor adverse      | N/A        | Minor adverse      |
| steaming times   | Other fleets                        | Negligible      | Low        | Negligible         | N/A        | Negligible         |
| Impact 5: Interference   | Static gear vessels                 | Medium          | Low        | Minor adverse      | N/A        | Minor adverse      |
| with fishing activities (navigational conflict)                                  | Towed gear vessels                  | Low             | Negligible | Negligible         | N/A        | Negligible         |
| Impact 6: Safety issues for fishing vessels                                      | All fleets                          | N/A             |            | Broadly acceptable | N/A        | Broadly acceptable |
| Impact 7: Seabed obstacles   | All fleets                          | N/A             |            | Broadly acceptable | N/A        | Broadly acceptable |
| Operation  |                                     |                 |            |                    |            |                    |
| Impact 1: Potential impacts on commercially exploited fish and shellfish species | See Chapter 10 Fish and             | Shellfish Ecolo | ogy        | Minor adverse      | N/A        | Minor adverse      |
| Impact 2: Complete loss  | Dutch beam trawlers                 | Low             | Low        | Minor adverse      | N/A        | Minor adverse      |
| or restricted access to fishing grounds  | Dutch seine netters                 | Low             | Low        | Minor adverse      | N/A        | Minor adverse      |
|  | Other Dutch methods                 | Low/Medium      | Negligible | Negligible         | N/A        | Negligible         |

| Potential Impact  | Receptor  | Sensitivity | Magnitude  | Significance  | Mitigation | Residual Impact |
|---|---|-------------|------------|---------------|------------|-----------------|
|   | Belgian beam trawlers   | Low         | Low        | Minor adverse | N/A        | Minor adverse   |
|   | Belgian otter trawlers  | Low         | Negligible | Negligible    |            | Negligible      |
